## 1. General Description

The FL7707N is a single-chip solution for a-Si TFT LCD that combines a source driver, power supply circuit to drive a-Si TFT dot matrix LCD with 800RGBx2047 dots at maximum. The FL7707N supports MIPI Interface.

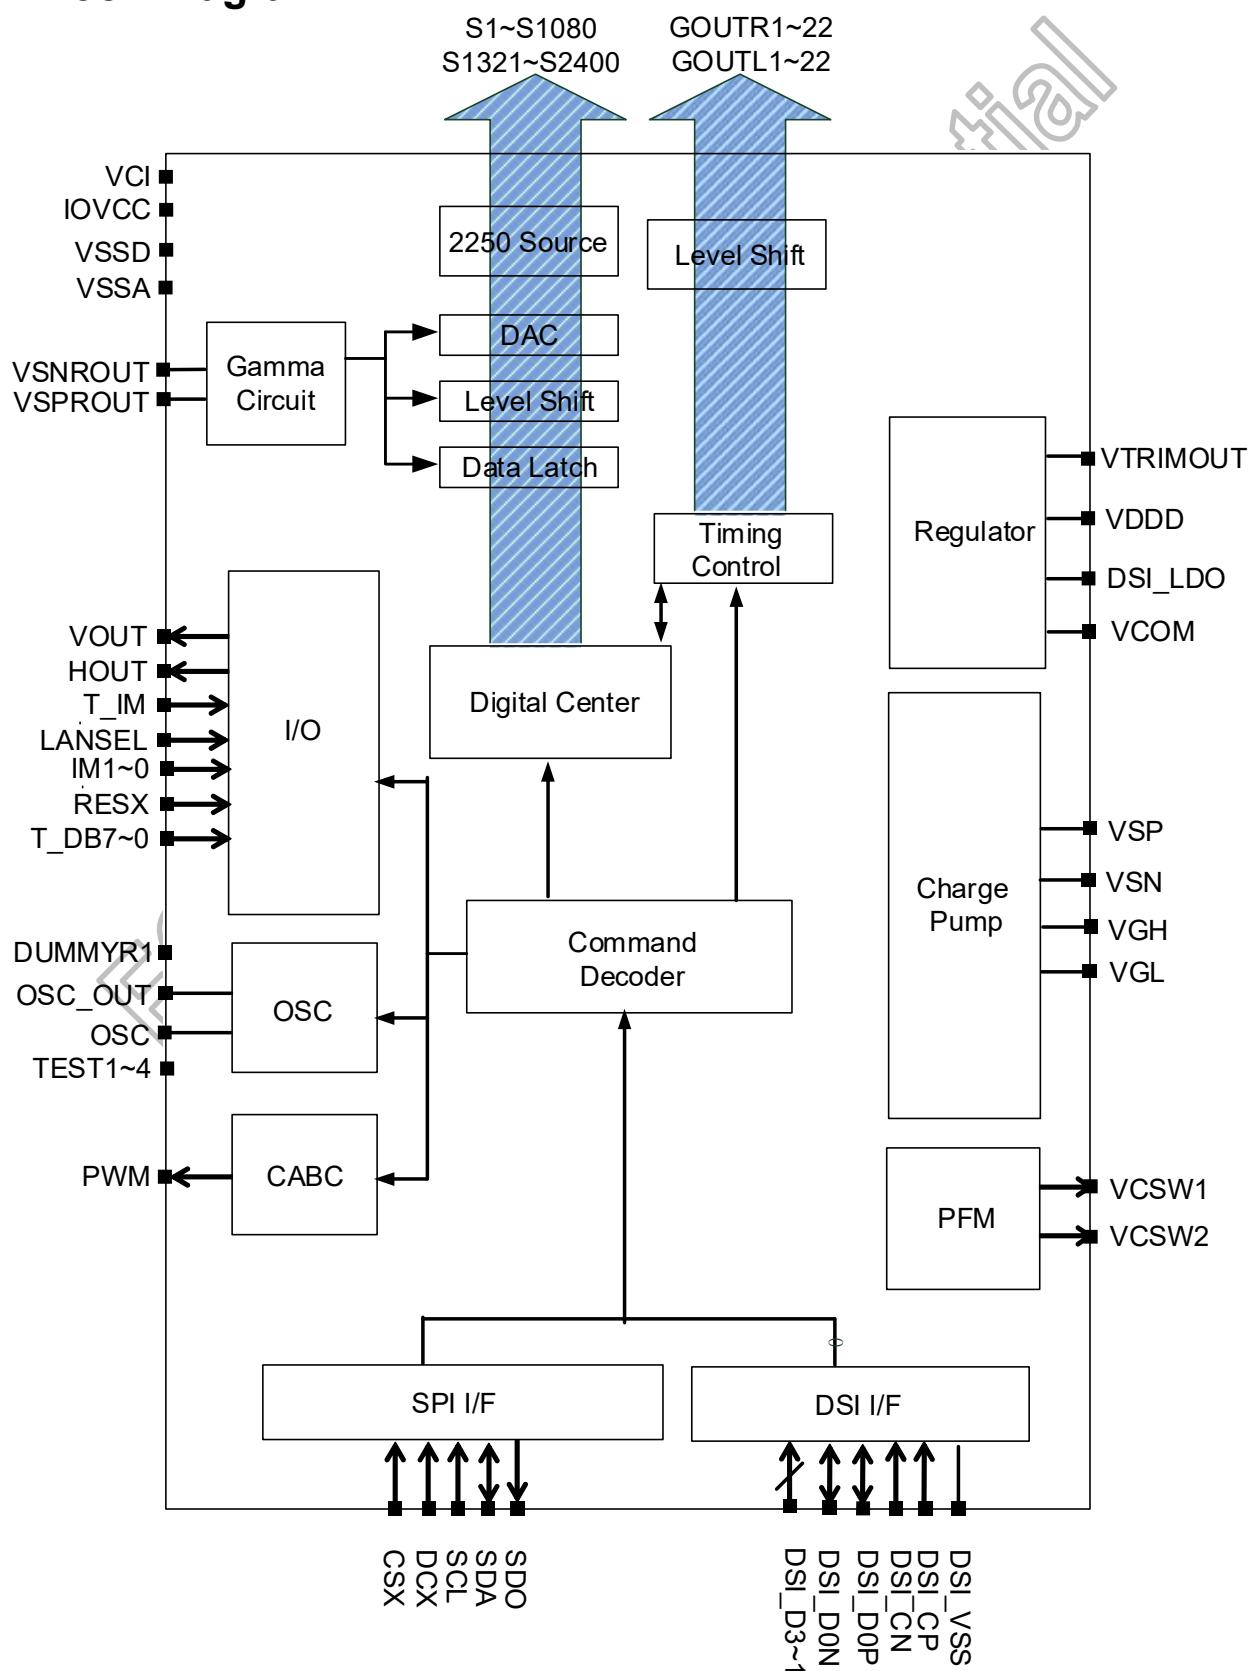

The FL7707N incorporates step-up and voltage follower circuits to generate drive voltage required for a-Si TFT and gate in panel (GIP) which including a dynamic backlight control function to control backlight brightness depending on image data, reducing power consumption at the backlight with the slightest influence on image quality.

The FL7707N is suitable for small or medium-sized portable mobile solutions requiring long-term driving capabilities, such as digital mobile phones, PDAs and Smartphones.

## 2. Features

- Single chip solution for a HD800 GIP (Gate In Panel) type TFT LCD display
- Display Resolution:
  - 800RGB x (4xNL + RES\_V\_LSB)
  - 768RGB x (4xNL + RES\_V\_LSB)
  - 750RGB x (4xNL + RES\_V\_LSB)
  - 720RGB x (4xNL + RES\_V\_LSB)
  - 640RGB x (4xNL + RES\_V\_LSB)
  - 600RGB x (4xNL + RES\_V\_LSB)
  - 540RGB x (4xNL + RES\_V\_LSB)
  - 440RGB x (4xNL + RES\_V\_LSB)
  - 400RGB x (4xNL + RES\_V\_LSB)
  - 480RGB x (4xNL + RES\_V\_LSB)
- Display Color Modes:
  - Full color mode: 16.7M colors
  - Reduce color mode: 262k colors
  - Reduce color mode: 65k colors
  - Idle mode: 8 colors
- Display Interface:
  - MIPI Display Serial Interface (DSI V1.01)
- On chip:
  - VGH/VGL for GIP gate control
  - 1-dot / 1+2-dot / 2-dot / 3-dot / 4-dot / 8-dot / column / Zig-Zag inversion
  - Gamma correction function
  - Oscillator for display clock generation
  - Internal OTP programming voltage generator
  - 4 times MTP for VCOM setting、ID setting
  - CABC (Content Adaptive Brightness Control) function
  - DGC (Digital Gamma Correction) function
  - Color Enhancement function
- Input power:
  - External power IC and PFM:
    - I/O and interface power supply (IOVCC): 1.65V to 3.3V
    - Analog power supply (VCI): 2.5V to 3.3V
  - Three-Power Mode:
    - I/O and interface power supply (IOVCC): 1.65V to 3.3V
    - Analog power supply (VSP): 4.5V to 6.2V
    - Analog power supply (VSN): -4.5V to -6.2V
- Output voltage:
  - Positive source output voltage level: VSPR=3.3V to 5.6V
  - Negative source output voltage level: VSNR=-5.6V to -3.3V
  - Positive gate driver output voltage level: VGH=+10V to +20V
  - Negative gate driver output voltage level: VGL=-7.5V to -15V
  - VCOM=-3.5V to 0V

### 3. Block Diagram

## 4. Pin Description

### 4.1 Power Supply Pins

Symbol	Name	Description	Connection when not used
IOVCC	I/O Power	Power supply for logic circuit.	-
VCI	Analog Power	Power supply for analog circuit.	-
VSSA	Analog GND	System ground for analog system.	-
VSSD	I/O GND	System ground for logic circuit.	-
DSI_VSS	MIPI GND	DSI interface analog ground.	-

### 4.2 Interface Logic Pins

Symbol	I/O	Description	Connection when not used																																																																								
IM1~0 LANSEL	I	Interface mode select pins. IM1~IM0 and LANSEL are used for the combination of polarity swap and data lane swap of DSI.  <table border="1" data-bbox="436 819 1246 1156"> <tr> <th>IM1</th><th>IM0</th><th>LANSEL</th><th>D0P/N</th><th>D1P/N</th><th>CP/N</th><th>D2P/N</th><th>D3/P/N</th></tr> <tr> <td>0</td><td>0</td><td>0</td><td>D3P/N</td><td>D2P/N</td><td>CP/N</td><td>D1P/N</td><td>D0P/N</td></tr> <tr> <td>0</td><td>1</td><td>0</td><td>D3N/P</td><td>D2N/P</td><td>CN/P</td><td>D1N/P</td><td>D0N/P</td></tr> <tr> <td>1</td><td>0</td><td>0</td><td>D0P/N</td><td>D1P/N</td><td>CP/N</td><td>D2P/N</td><td>D3P/N</td></tr> <tr> <td>1</td><td>1</td><td>0</td><td>D0N/P</td><td>D1N/P</td><td>CN/P</td><td>D2N/P</td><td>D3N/P</td></tr> <tr> <td>0</td><td>0</td><td>1</td><td>D2P/N</td><td>D1P/N</td><td>CP/N</td><td>D0P/N</td><td>D3P/N</td></tr> <tr> <td>0</td><td>1</td><td>1</td><td>D2N/P</td><td>D1N/P</td><td>CN/P</td><td>D0N/P</td><td>D3N/P</td></tr> <tr> <td>1</td><td>0</td><td>1</td><td>D3P/N</td><td>D0P/N</td><td>CP/N</td><td>D1P/N</td><td>D2P/N</td></tr> <tr> <td>1</td><td>1</td><td>1</td><td>D3N/P</td><td>D0N/P</td><td>CN/P</td><td>D1N/P</td><td>D2N/P</td></tr> </table>	IM1	IM0	LANSEL	D0P/N	D1P/N	CP/N	D2P/N	D3/P/N	0	0	0	D3P/N	D2P/N	CP/N	D1P/N	D0P/N	0	1	0	D3N/P	D2N/P	CN/P	D1N/P	D0N/P	1	0	0	D0P/N	D1P/N	CP/N	D2P/N	D3P/N	1	1	0	D0N/P	D1N/P	CN/P	D2N/P	D3N/P	0	0	1	D2P/N	D1P/N	CP/N	D0P/N	D3P/N	0	1	1	D2N/P	D1N/P	CN/P	D0N/P	D3N/P	1	0	1	D3P/N	D0P/N	CP/N	D1P/N	D2P/N	1	1	1	D3N/P	D0N/P	CN/P	D1N/P	D2N/P	GND
IM1	IM0	LANSEL	D0P/N	D1P/N	CP/N	D2P/N	D3/P/N

RESX	I	Reset pin. This signal will reset the device and must be applied to properly initialize the chip.	-																																																																								
VOUT	O	Frame synchronization output signal pin.	OPEN																																																																								
HOUT	O	Scan line synchronization output signal pin.	OPEN																																																																								

Note: "1" = IOVCC Level, "0" = VSSD Level.

### 4.3 MIPI Interface Pins

Symbol	I/O	Description	Connection when not used
DSI_D0P, DSI_D0P	I/O	High speed interface data differential signal input/output pins.	OPEN/GND
DSI_CP, DSI_CN	I	High speed interface clock differential signal input pins.	OPEN/GND
DSI_D3P~1P, DSI_D3N~1N	I	High speed interface data differential signal input pins.	OPEN/GND

#### 4.4 Driver Output Pins

Symbol	I/O	Description	Connection when not used
<b>S1 to S1125 S1276 to S2400</b>	<b>O</b>	Pixel electrode driving output	Open
		Display Resolution      Used Source Pins	
		800RGB      S1~S1200 and S1201~S2400	
		768RGB      S1~S1152 and S1249~S2400	
		750RGB      S1~S1125 and S1276~S2400	
		720RGB      S1~S1080 and S1321~S2400	
		640RGB      S1~S960 and S1441~S2400	
		600RGB      S1~S900 and S1501~S2400	
		540RGB      S1~S810 and S1591~S2400	
		440RGB      S1~S660 and S1741~S2400	
		400RGB      S1~S600 and S1801~S2400	
		480RGB      S1~S720 and S1681~S2400	
<b>CGOUTL_1~22</b>	<b>O</b>	Gate control signals for panel.	Open
<b>CGOUTR_1~22</b>			
<b>VCOM</b>	<b>O</b>	Regulator output for common voltage of panel	-

#### 4.5 DC/DC Converter Pins

Symbol	I/O	Description	Connection when not used
<b>VSP</b>	<b>I</b>	Input voltage from the set-up circuit.	-
<b>VSN</b>	<b>I</b>	Input voltage from the set-up circuit.	-
<b>VGH</b>	<b>O</b>	Output voltage from the step-up circuit.	-
<b>VGL</b>	<b>O</b>	Output voltage from the step-up circuit.	-
<b>DSI_LDO</b>	<b>O</b>	High speed interface regulator output pin.	Open
<b>VSPROUT</b>	<b>O</b>	Output voltage generated from VSP. Output for positive gamma voltage generator.	-
<b>VSNROUT</b>	<b>O</b>	Output voltage generated from VSN. Output for negative gamma voltage generator.	-
<b>VDDD</b>	<b>O</b>	Reference voltage for internal logic.	-
<b>VTRIMOUT</b>	<b>O</b>	Reference voltage for internal voltage generating circuit.	-
<b>VCSW1</b>	<b>O</b>	PFM and Power IC control output for DC/DC converter to generate VSP.	-
<b>VCSW2</b>	<b>O</b>	PFM and Power IC control output for DC/DC converter to generate VSN.	-

#### 4.6 CABC Control Pins

Symbol	I/O	Description	Connection when not used
<b>PWM</b>	<b>O</b>	This pin is connecting with the external LED driver.	Open

#### 4.7 Test Pins

Symbol	I/O	Description	Connection when not used
<b>OSC</b>	I	Oscillator test pin	Open
<b>CSX</b>	I	Chip select input pin ("Low" enable) in RGB I/F test mode.	OPEN
<b>DCX</b>	I	Command/parameter selection in RGB I/F test mode. Low: Select command. High: Select data.	IOVCC/GND/ OPEN
<b>SCL</b>	I	A synchronous clock signals in RGB I/F test mode.	IOVCC/GND/ OPEN
<b>SDA</b>	I/O	Serial data input/output pin in RGB I/F test mode.	IOVCC/GND/ OPEN
<b>SDO</b>	O	A serial data output pin in RGB I/F test mode.	OPEN
<b>T_DB7~0</b>	I	8-bit input data bus in RGB I/F test mode.	IOVCC/GND/ OPEN
<b>T_IM</b>	I	Let driver IC into RGB I/F test mode if set T_IM= high.	Open
<b>OSC_OUT</b>	O	Test pin.	Open
<b>NVDDDOUT</b>	O	Test pin.	Open
<b>NVTRIMOUT</b>	O	Test pin.	Open

## 5. Function Description

### 5.1 SPI Interface

The selection of serial interface is by T\_IM. FL7707N can support DPI/DBI type-C Option 1.

T_IM	Interface mode
0	MIPI Interface
1	DPI/DBI type-C Option 1 (9-bit SPI)

Table 5-1: DBI TYPE-C Serial Interface Selection Table

The serial interface is used to communication between the MPU and the LCD driver chip. It contains CSX (chip select), SCL (serial clock), SDA (serial data input/output). Serial clock (SCL) can be stopped when no communication is necessary.

#### 5.1.1 SPI Interface Write Mode

In SPI I/F Write Mode, the serial data packet contains a control bit DCX and a transmission byte. If DCX is low, the transmission byte is command byte. If DCX is high, the transmission byte is stored in to command register. The MSB is transmitted first. The serial interface is initialized when CSX is high. In this state, SCL clock pulse or serial input/output data (SDA/SDO) have no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission.

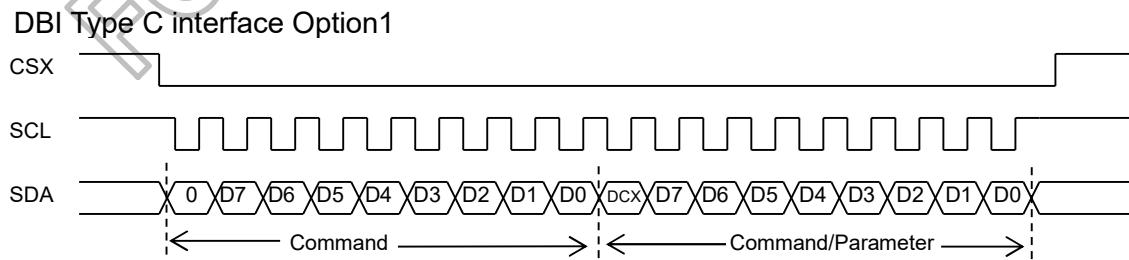

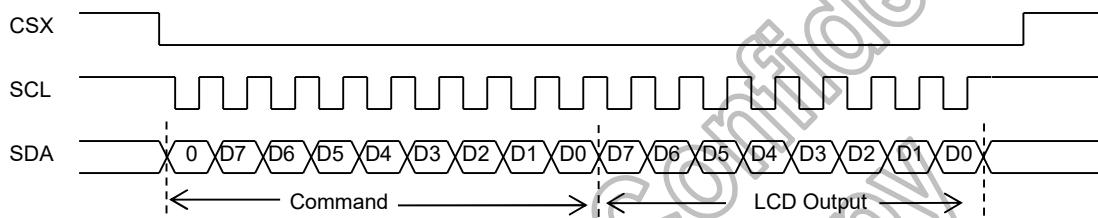

Figure 5-1: DBI Type C interface Option 1 write mode

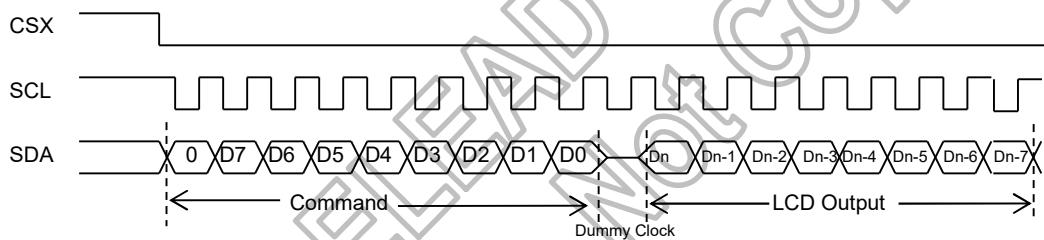

### 5.1.2 SPI Interface Read Mode

In SPI I/F Read Mode, the host controller first has to send a command and then the following byte is transmitted to host controller in the SDA. The read mode has two type : one is command data 8-bits read and one is over 8-bits read.

DBI Type C interface Option1: Read 8bits

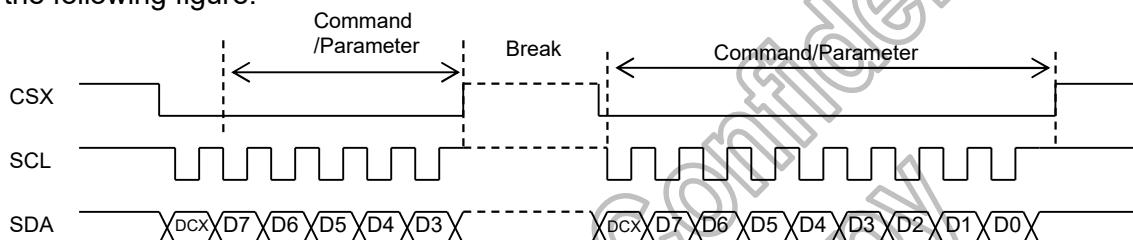

DBI Type C interface Option1: Read Over 8bits

**Figure 5-2: DBI Type C interface Option 1 read mode**

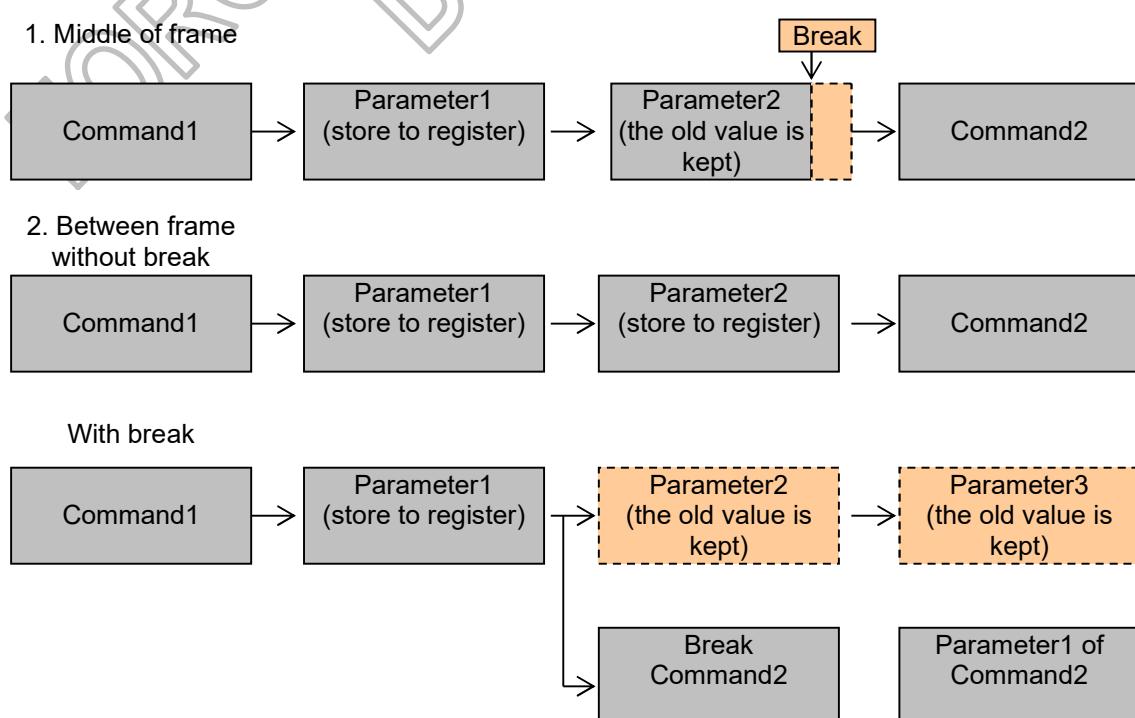

### 5.1.3 Break and Pause Sequences

If there is a break on data transmission when transmit a command before a whole byte has been completed, then the driver IC will have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select line (CSX) is next activated. See the following figure.

**Figure 5-3: Driver IC data transfer recovery**

If a one or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than retransmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown:

**Figure 5-4: Break during parameter**

The host processor can pause a write sequence by pulling the CSX signal high between command or data bytes. The driver IC shall wait for the host processor to drive CSX low before continuing the write sequence at the point where the sequence was paused.

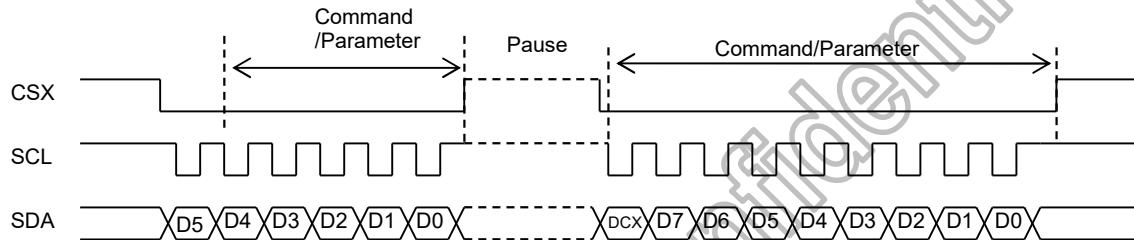

Figure 5-5: Driver IC data transfer pause

There are 4 cases where there is possible to see this kind of pause:

1. Command – Pause – Command
2. Command – Pause – Parameter
3. Parameter – Pause – Command
4. Parameter – Pause – Parameter

## 5.2 MIPI Interface

The Display Serial Interface standard defines protocols between a host processor and peripheral devices that adhere to MIPI Alliance standards for mobile device interfaces. The DSI standard builds on existing standards by adopting pixel formats and command set defined in MIPI Alliance standards.

DSI-compliant peripherals support either of two basic modes of operation: Command Mode and Video Mode. Which mode is used depends on the architecture and capabilities of the peripheral. The FL7707N only support Video mode.

Video Mode refers to operation in which transfers from the host processor to the peripheral take the form of a real-time pixel stream. In normal operation, the driver IC relies on the host processor to provide image data at sufficient bandwidth to avoid flicker or other visible artifacts in the displayed image. Video information should only be transmitted using High Speed Mode.

Lane Pair	HOST(Master)/ Driver IC(Slave)
Clock Lane	<ul style="list-style-type: none"><li>- Unidirectional Lane</li><li>- Clock Only</li><li>- Escape mode (ULPS only)</li></ul>
Data Lane 0	<ul style="list-style-type: none"><li>- Bi-directional Lane</li><li>- Forward High Speed</li><li>- Bi-directional Escape Mode</li><li>- Bi-directional LPDT</li></ul>
Data Lane 1 Data Lane 2 Data Lane 3	<ul style="list-style-type: none"><li>- Unidirectional Lane</li><li>- Forward High Speed</li><li>- Escape mode (ULPS only)</li><li>- NO LPDT</li></ul>

Table 5-2: MIPI Interface Configuration

## 5.2.1 DSI General Interface Communication

The driver IC uses data and clock lane differential pairs for DSI. Both differential lane pairs can be driven Low Power (LP) or High Speed (HS) mode. Low Power mode means that each line of the differential pair is used in single end mode and a differential receiver is disable (A termination resistor of the receiver is disable) and it can be driven into a low power mode.

High Speed mode means that differential pairs (The termination resistor of the receiver is enable) are not used in the single end mode. There are used different modes and protocol in each mode when there is wanted to transfer information from the HOST to the driver IC and vice versa.

State code	Line voltage Levels		High speed	Low power	
	DP	DN		Control mode	Escape mode
HS-0	HS Low	HS High	Differential-0	Note 1	Note 1
HS-1	HS High	HS Low	Differential-1	Note 1	Note 1
LP-00	LP Low	LP Low	N/A	Bridge	Space
LP-01	LP Low	LP High	N/A	HS-Rqst	Mark-0
LP-10	LP High	LP Low	N/A	LP-Rqst	Mark-1
LP-11	LP High	LP High	N/A	Stop	Note 2

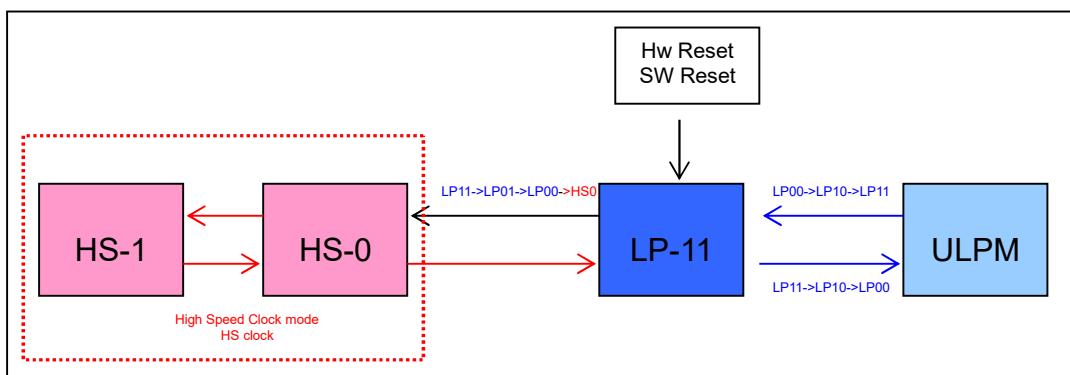

Note 1 : During high-speed transmission, the low power receivers observe LP-00 on the lines.

Note 2 : If LP-11 occurs during Escape mode, the lane returns to Stop state (Control mode LP-11)

**Table 5-3: Lane State Description**

### 5.2.1.1 DSI Clock Lane

The principle flow chart of the different clock lanes power modes is illustrated below.

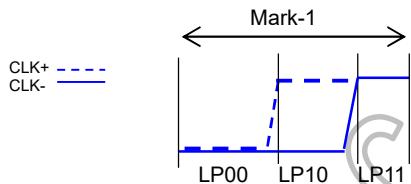

**Figure 5-6: DSI Clock Lane State Diagram**

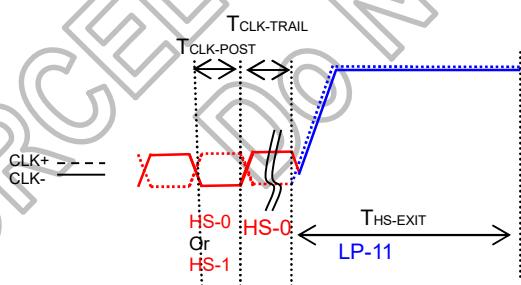

LK+/- lanes can be driven to the Low Power Mode (LPM), when DSI-CLK lanes are entering LP-11:

1. After SW Reset, HW Reset or Power On Sequence =>LP-11
2. After DSI-CLK+/- lanes are leaving Ultra Low Power Mode (ULPM, LP-00) =>LP-10 =>LP-11 (LPM). This sequence is illustrated below.

**Figure 5-7: From ULPM to LPM**

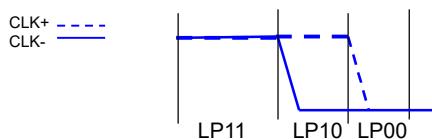

3. After DSI-CLK+/- lanes are leaving High Speed Clock Mode (HSCM, HS-0 or HS-1 State Code) =>HS-0 =>LP-11 (LPM). This sequence and all three mode changes are illustrated below.

**Figure 5-8: From High Speed Clock mode to LPM**

### Ultra Low Power Mode (LP-00: ULPM)

DSI-CLK+/- lanes can be driven to the Ultra Low power Mode (ULPM), when DSI-CLK lanes are entering LP-00 State. The entering way is from the Low Power Mode (LPM, LP-11 State) =>LP-10 =>LP-00 (ULPM). This sequence is illustrated below.

**Figure 5-9: From LPM mode to ULPM**

### High Speed Clock Mode (HSCM)

DSI-CLK+/- lanes can be driven to the High Speed Clock Mode (HSCM), when DSI-CLK lanes are starting to work between HS-0 and HS-1 State. The entering way is from the Low Power Mode (LPM, LP-11 State ) =>LP-01 =>LP-00 =>HS-0 =>HS-0/1 (HSCM). This sequence is illustrated below.

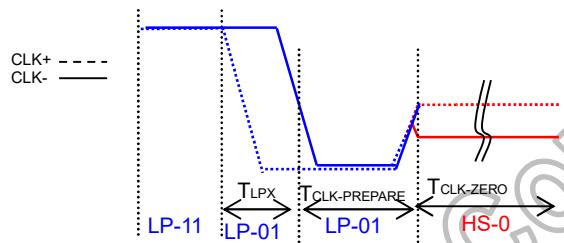

Figure 5-10: From LPM mode to HSCM

### High Speed Clock Burst

The high speed clock (DSI-CLK+/-) is started before high speed data is sent via DSI-Dn+/- lanes. The high speed clock continues clocking after the high speed data sending has been stopped.

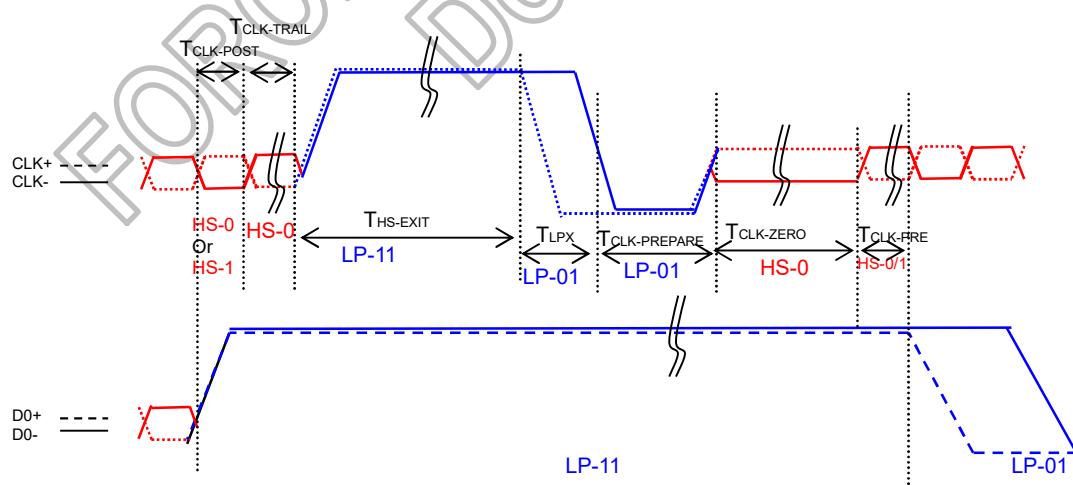

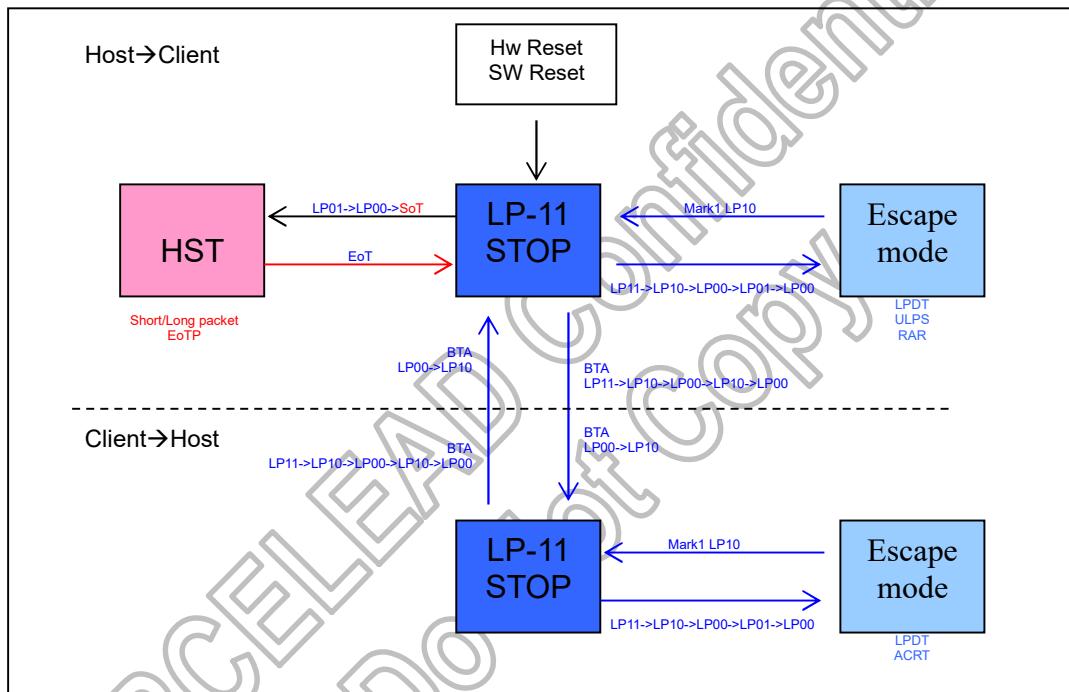

Figure 5-11: Switching the Clock Lane between HSCM and LPM

### 5.2.1.2 DSI-D0 Data Lane

DSI-D0+/- Data Lanes can be driven in different modes which are: Escape Mode, High-Speed Data Transmission and Bus Turnaround Request. The flow chart of the D0 data lanes is illustrated below.

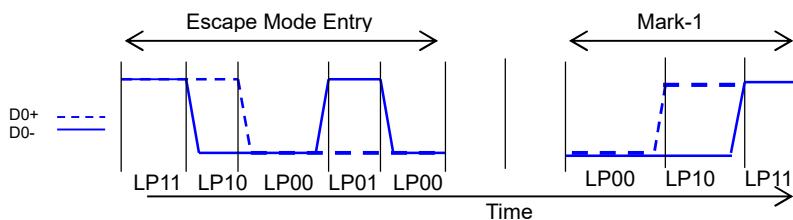

**Figure 5-12: DSI Data Lane D0 State Diagram**

Description	Operation Code
High Speed Data Transmission Burst	LP11->LP01->LP00
Escape mode entry	LP11->LP10->LP00->LP01->LP00
Bus turn around	LP11->LP10->LP00->LP10->LP00
Exit Escape mode (Mark-1)	LP00->LP10->LP11

**Table 5-4: Data Lane D0 Operation Modes**

### ESCAPE MODE

Data lanes (DSI-D0+/-) can be used in different Escape Modes when data lanes are in Low Power (LP) mode.

**Figure 5-13: DSI Data Lane D0 general escape mode sequence**

FL7707N can support three different Escape Commands. The commands (EC) can be divided 2 different groups: Mode or Trigger. The HOST is informing to the driver IC that it is controlling data lanes (DSI-D0+/-) with the mode. Escape commands are defined as below table.

Escape Command	Command Type	Entry Command Pattern (First Bit→Last Bit Transmitted)
Low Power Data Transmission	Mode	1110 0001
Ultra-Low Power mode	Mode	0001 1110
Remote Application Reset	Trigger	0110 0010
Tearing Effect	Trigger	0101 1101
Acknowledge	Trigger	0010 0001

Table 5-5: Escape Mode Commands

### Low-Power Data Transmission (LPDT)

The HOST can send data to the driver IC in Low-Power Data Transmission (LPDT) mode when data lanes are entering in Escape Mode and Low-Power Data Transmission (LPDT) command will been sent to this driver IC. The driver IC is also using the same sequence when it is sending data to the HOST. The Low Power Data Transmission (LPDT) is using a following sequence:

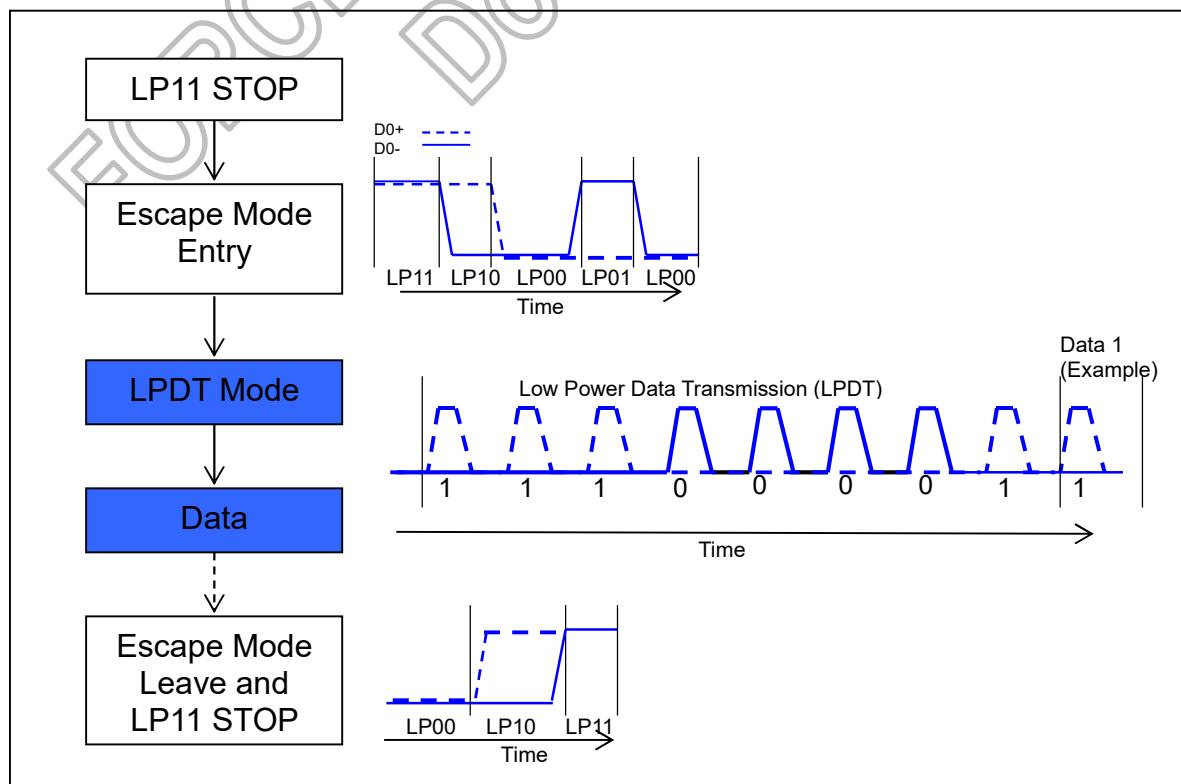

Figure 5-14: DSI Data Lane D0 LPDT sequence

### Ultra Low Power State (ULPS)

The driver IC can enter this Ultra Low Power Sate to save power consumption when HOST send this ULPS command. Ultra Low Power State is using below sequence:

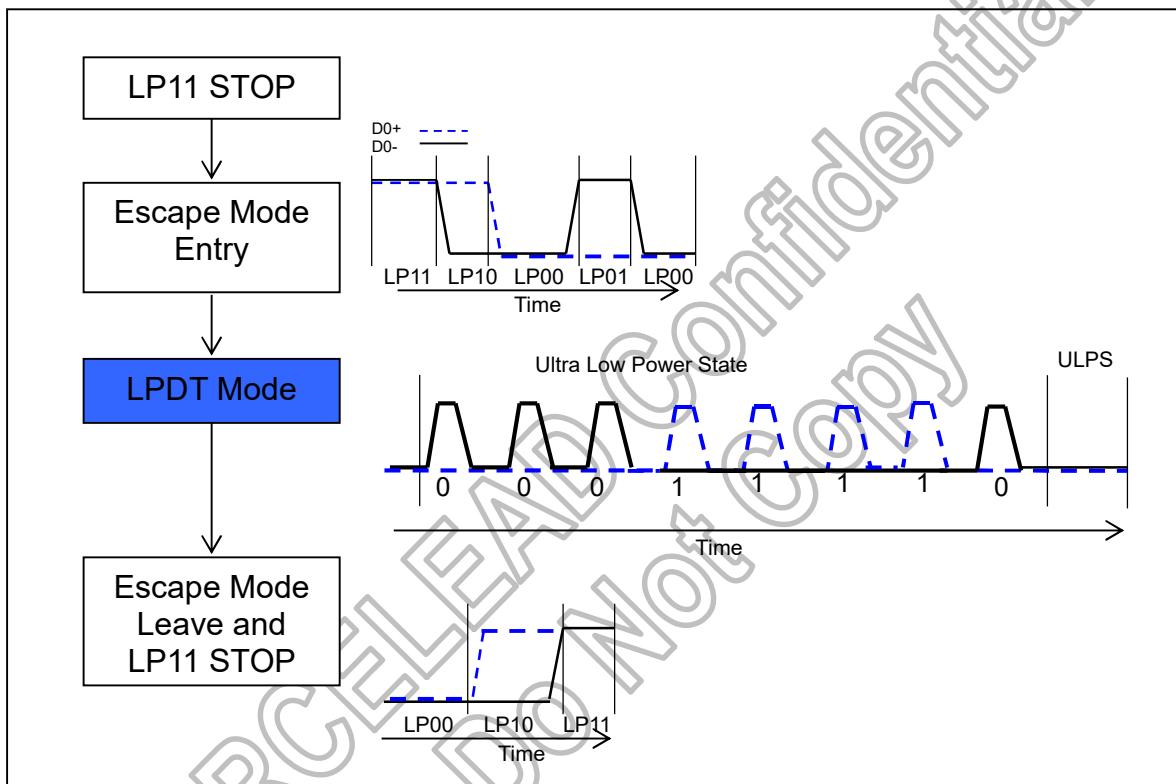

Figure 5-15: DSI Data Lane D0 ULPS sequence

### Remote Application Reset (RAR)

The HOST can inform to the driver IC that it should be reset in Remote Application Reset (RAR) trigger when data lanes are entering in Escape Mode. The Remote Application Reset (RAR) is using a following sequence:

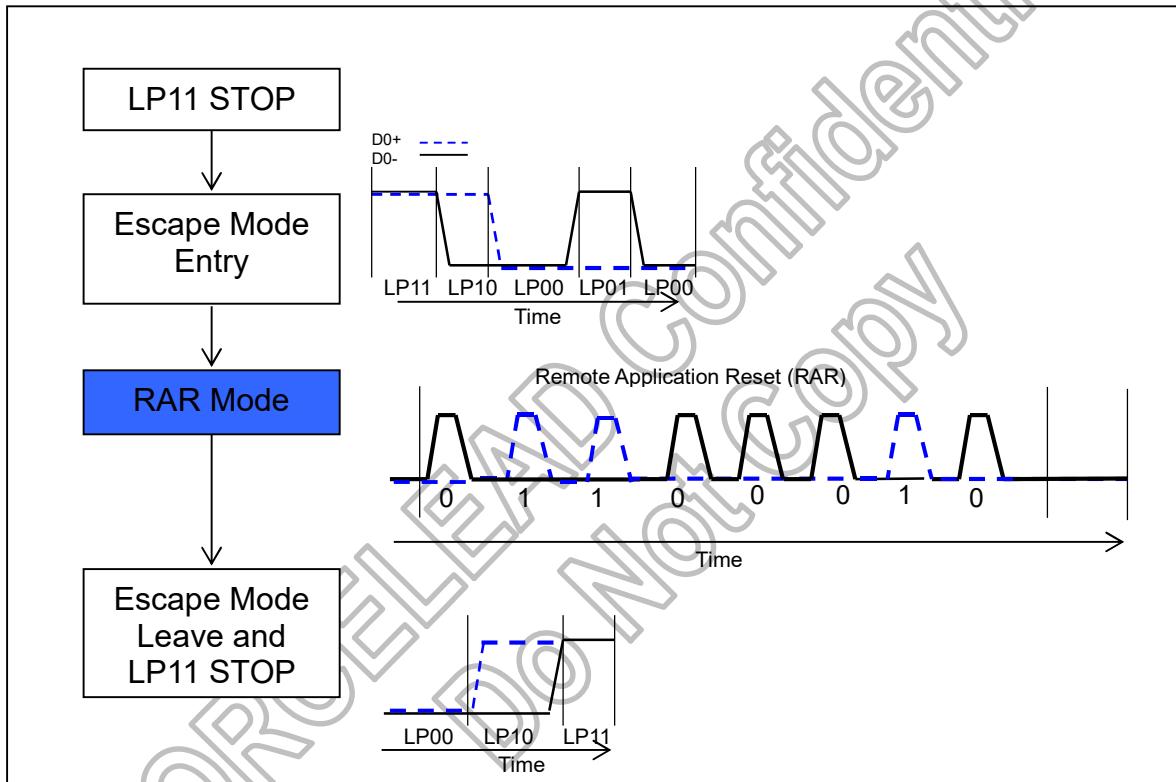

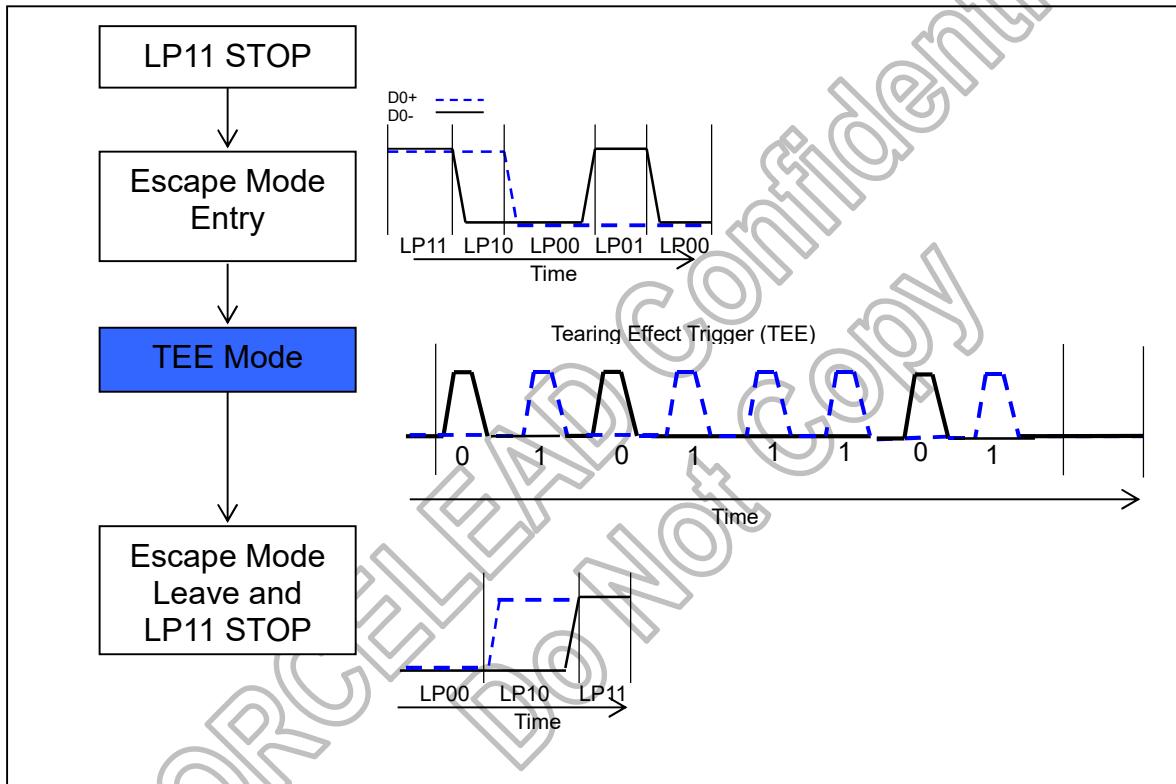

Figure 5-16: DSI Data Lane D0 RAR sequence

### Tearing Effect (TEE)

The driver IC can inform to the HOST when a tearing effect event (New V-synch) has been happen on the driver IC by Tearing Effect (TEE). The Tearing Effect (TEE) is using a following sequence:

**Figure 5-17: DSI Data Lane D0 TEE sequence**

### Acknowledge (ACK)

The driver IC can inform to the HOST when an error has not recognized on it by Acknowledge (ACK). The Acknowledge (ACK) is using a following sequence:

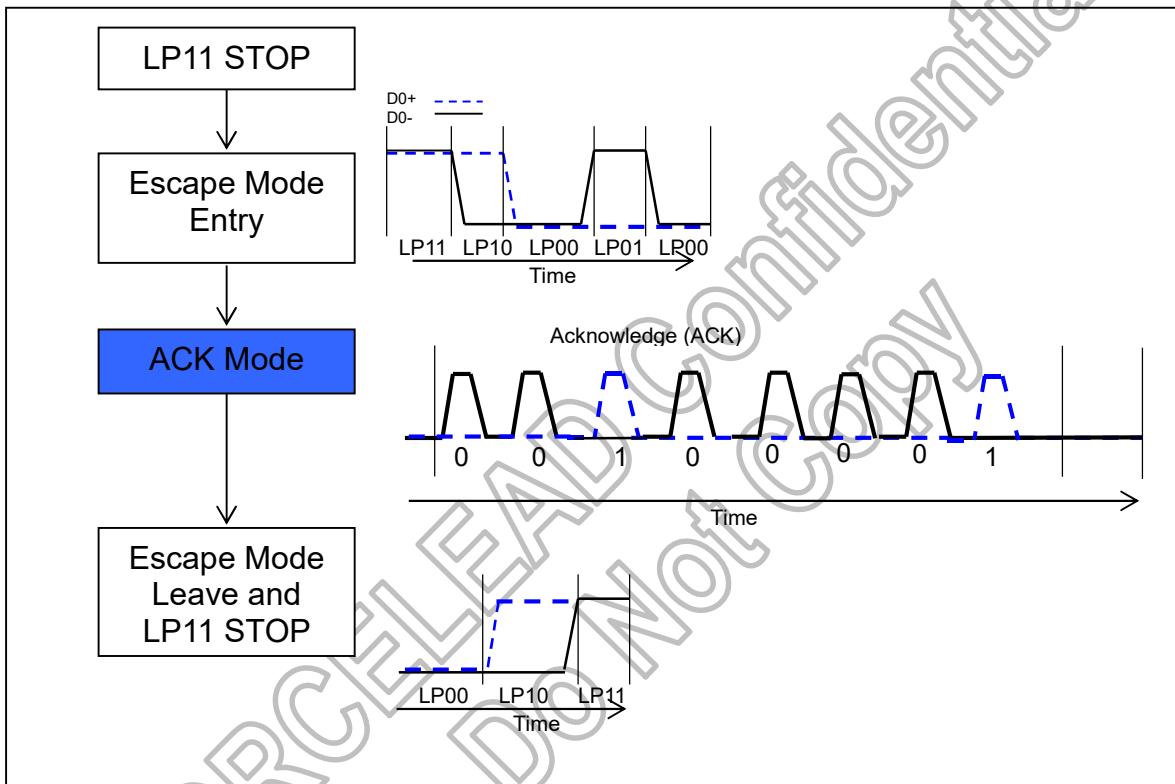

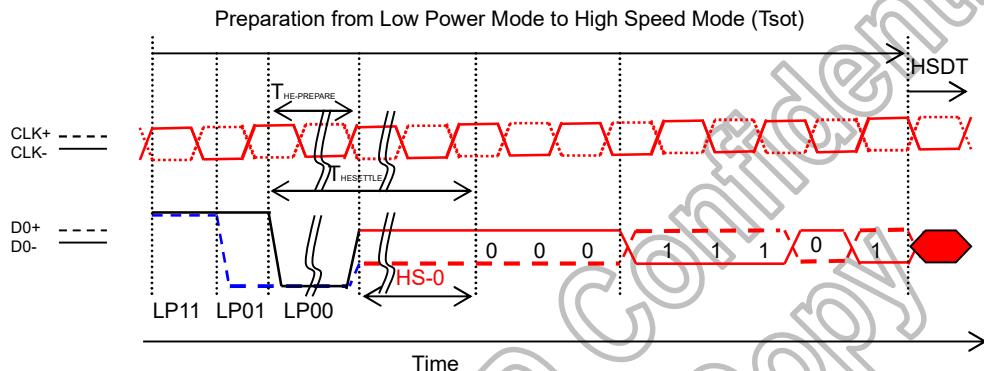

Figure 5-18: DSI Data Lane D0 ACK sequence

## High Speed Data Transmission

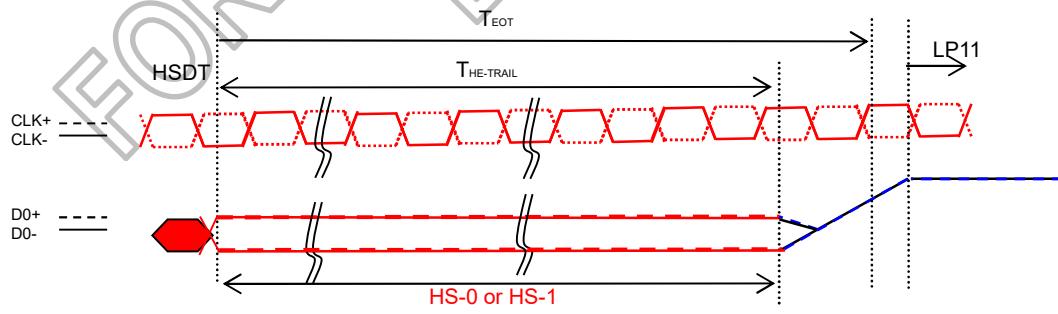

The driver IC is entering High-Speed Data Transmission when Clock lanes DSI-CLK+/- have already been entered in the High-Speed Clock Mode by the HOST. Data lanes of the driver IC are entering (TSOT) in the High-Speed Data Transmission (HSDT) as below figure.

**Figure 5-19: DSI Data Lane Entering High Speed Data Transmission**

# Leaving High Speed Data Transmission

The driver IC is leaving the High-Speed Data Transmission (TEOT of HSDT) when Clock lanes DSI-CLK+/- are in the High-Speed Clock Mode by the HOST and it is kept until data lanes are in LP-11 mode. Data lanes of the driver IC are leaving from the High-Speed Data Transmission (TEOT of HSDT) as follows

**Figure 5-20: DSI Data Lane Entering High Speed Data Transmission**

### Bus Turnaround (BTA)

The HOST or driver IC, which is controlling DSI-D0+/- Data Lanes, can start a bus turnaround procedure when it wants information from a receiver, which can be the HOST or driver IC. The HOST or driver IC is using the same sequence when this bus turnaround procedure is used. This sequence is described for reference purposes, when the HOST wants to do the bus turnaround procedure to the driver IC, as below.

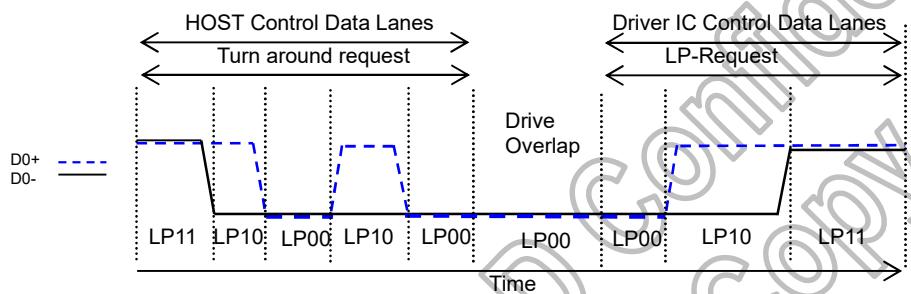

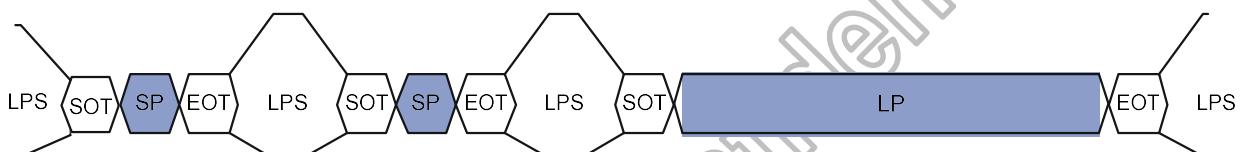

Figure 5-21: DSI Bus Turn Around Procedure

### 5.2.2 DSI Packet Level Communication

The DSI protocol permits multiple packets which is useful for events such as peripheral initialization, where many registers may be loaded separate write commands at system startup. Below figure illustrates multiple HS Transmission packets.

LPS: Low power state  
 SOT: Start of Transmission  
 SP: Short Packet  
 LP: Long Packet  
 EOT: End of Transmission

**Figure 5-22: DSI multiple HS transmission packets**

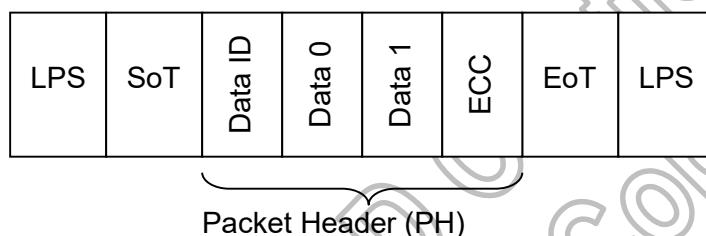

The packet includes two types which are Long packet and short packet. The first byte of the packet, the Data Identifier (DI), includes information specifying the length of the packet. Command Mode systems send commands and an associated set of parameters, with the number of parameters depending on the command type.

### 5.2.2.1 General Packet Structure

#### Short packets

Specify the payload length using the Data Type field and are from two to nine bytes in length. Short packet is used for most Command Mode commands and associated parameters. Where short packets format include an 8-bit Data ID followed by zero to seven bytes and an 8-bit ECC. Below figure shows the structure of the Short packet.

**SOT:** Start of Transmission

**DI(Data ID):** 8-bit Contain Virtual Channel Identifier and Data Type.

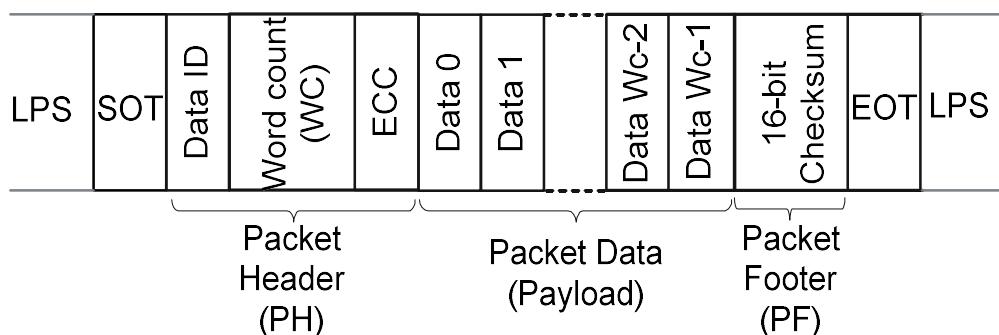

**Data 0 and Data 1:** Packet Data (8+8bit)

**ECC(Error Correction Code):** The Error Correction Code allows single-bit errors to be corrected and 2-bit errors to be detected in the Packet Header.

Figure 5-23: Structure of the short packet

#### Long packets

Specify the payload length using a two-byte Word Count field and then the payload maybe from 0 to 65,541 bytes in length. Long packets permit transmission of large blocks of pixel or other data. Below figure shows the structure of the Long packet. Long Packet Header composed of three elements: an 8-bit Data Identifier, a 16-bit Word Count, and 8-bit ECC. The Packet Footer has one element, a 16-bit checksum. Long packets can be from 6 to 65,541 bytes in length. Where  $65,541 \text{ bytes} = (216-1) + 4 \text{ bytes PH} + 2 \text{ bytes PF}$

**DI (Data ID):** Contain Virtual Channel Identifier and Data Type.

**WC (Word Count):** 8+8 bits The receiver use WC to define packet end.

**ECC (Error Correction Code):** The Error Correction Code allows single-bit errors to be corrected and 2-bit errors to be detected in the Packet Header.

**PF(Packet Footer):** Mean 16-bit Checksum.

Figure 5-24: Structure of the long packet

According to packet form, basic elements include DI and ECC. Figure 4.44 shows format of Data ID.

DI7	DI6	DI5	DI4	DI3	DI2	DI1	DI0
VC (Virtual Channel)						DT (Data Type)	

DI[7:6] → These two bits identify the data as directed to one of four virtual channels.

DI[5:0]: These six bits specify the Data Type, which specifies the size, format and, in some cases, the interpretation of the packet contents.

Figure 5-25: Format of data ID

### Virtual Channel (VC)

Virtual Channel (VC) is a part of Data Identification (DI[7...6]) structure and it is used to address where a packet is wanted to send from the HOST. The FL7707N supports Virtual Channel only when VC = 00.

**Data Type (DT)**

Data Type (DT) is a part of Data Identification (DI[5...0]) structure and it is used to define a type of the used data on a packet.

<b>Data type, hex</b>	<b>Data type, binary</b>	<b>Description packet</b>	<b>Size</b>
05h	00 0101	DCS Write, no parameters	Short
15h	01 0101	DCS Write, 1 parameter	Short
01h	00 0001	Sync Event, V Sync Start	Short
11h	01 0001	Sync Event, V Sync End	Short
21h	10 0001	Sync Event, H Sync Start	Short
31h	11 0001	Sync Event, H Sync End	Short
02h	00 0010	Color Mode (CM) Off Command	Short
12h	01 0010	Color Mode (CM) On Command	Short
22h	10 0010	Shut Down Peripheral Command	Short
32h	11 0010	Turn On Peripheral Command	Short
13h	01 0011	Generic Short Write, 1 parameter	Short
23h	10 0011	Generic Short Write, 2 parameter	Short
14h	01 0100	Generic Read, 1 parameter	Short
29h	10 1001	Generic Long Write	Long
06h	00 0110	DCS READ, no parameters	Short
37h	11 0111	Set Maximum Return Packet Size	Short
09h	00 1001	Null Packet, no data	Long
19h	01 1001	Blanking Packet, no data	Long
39h	11 1001	DCS Long Write/write_LUT Command Packet	Long
0Eh	00 1110	Packed Pixel Stream, 16-bit RGB, 5-6-5 Format	Long
1Eh	01 1110	Packed Pixel Stream, 18-bit RGB, 6-6-6 Format	Long
2Eh	10 1110	Loosely Packed Pixel Stream, 18-bit RGB, 6-6-6 Format	Long
3Eh	11 1110	Packed Pixel Stream, 24-bit RGB, 8-8-8 Format	Long
X0h and XFh, unspecified	xx 0000 xx 1111	DO NOT USE All unspecified codes are reserved	-

**Table 5-6: Data Types from Host to the Driver IC**

<b>Data type, hex</b>	<b>Data type, binary</b>	<b>Description packet</b>	<b>Size</b>
02h	00 0010	Acknowledge with Error Report	Short
21h	01 0001	Generic short READ Response, 1 byte returned	Short
22h	01 0010	Generic short READ Response, 2 byte returned	Short
1Ah	01 1010	Generic Read Long Response	Long
1Ch	01 1100	DCS Long READ Response	Long

**Table 5-7: Data Types from the Driver IC to Host**

### Error Correction Code (ECC)

Error Correction Code (ECC) is a part of Packet Header (PH) and its purpose is to identify an error or errors on the Packet Header (PH).

Bits (P[7...0]) of the Error Correction Code (ECC) are defined, where the symbol '^' is presenting XOR function, as follows.

- P7 = 0
- P6 = 0
- P5 = D10^D11^D12^D13^D14^D15^D16^D17^D18^D19^D21^D22^D23
- P4 = D4^D5^D6^D7^D8^D9^D16^D17^D18^D19^D20^D22^D23
- P3 = D1^D2^D3^D7^D8^D9^D13^D14^D15^D19^D20^D21^D23
- P2 = D0^D2^D3^D5^D6^D9^D11^D12^D15^D18^D20^D21^D22
- P1 = D0^D1^D3^D4^D6^D8^D10^D12^D14^D17^D20^D21^D22^D23
- P0 = D0^D1^D2^D4^D5^D7^D10^D11^D13^D16^D20^D21^D22^D23

### PACKET DATA (PD) ON THE LONG PACKET

Packet Data (PD) of the Long Packet is defined after Packet Header (PH) of the Long Packet. The number of the data bytes is defined on chapter "Word Count (WC) on the Long Packet".

### PACKET FOOTER (PF) ON THE LONG PACKET

Packet Footer (PF) of the Long Packet is defined after the Packet Data (PD) of the Long Packet. The Packet Footer (PF) is a checksum value what is calculated from the Packet Data of the Long Packet .The checksum is using a 16-bit Cyclic Redundancy Check (CRC) value which is generated with a polynomial  $X^{16}+X^{12}+X^5+X^0$ .

### 5.2.2.2 Detail Format Description

#### **Generic Write, 1 Parameter, Data Type = 01 0011 (13h)**

Generic Write, 1 Parameter is always using a Short Packet from the HOST to the driver IC. The content of 2 payload bytes is “command” and “00h”.

#### **Generic Write, 2 Parameter, Data Type = 10 0011 (23h)**

Generic Write, 2 Parameter is always using a Short Packet from the HOST to the driver IC. The content of 2 payload bytes is “command” and “parameter”.

#### **Generic Long Write, Data Type = 10 1001 (29h)**

Generic Long Write is always using a Long Packet from the HOST to the driver IC. The content can include Command (No Parameters) or Command with 1 or more parameters.

#### **Generic Read, 1 Parameter, Data Type = 01 0100 (14h)**

Generic Read, 1 Parameter is always using a Short Packet from the HOST to the driver IC. The HOST has to define to the driver IC, what is the maximum size of the return packet. A command, what is used for this purpose, is “Set Maximum Return Packet Size”, which Data Type is 11 0111 and which is using Short Packet before the HOST can send “Generic Read, 1 Parameter” to the driver IC.

#### **Display Command Set Write, No Parameter, Data Type = 00 0101 (05h)**

Display Command Set (DCS) Write, No Parameter is always using a Short Packet from the HOST to the driver IC. The content of 2 payload bytes is “command” and “00h”.

#### **Display Command Set Write, 1 Parameter, Data Type = 01 0101 (15h)**

Display Command Set (DCS) Write, 1 Parameter is always using a Short Packet from the HOST to the driver IC. The content of 2 payload bytes is “command” and “parameter”.

#### **Display Command Set Long Write, Data Type = 11 1001 (39h)**

Display Command Set (DCS) Long Write is always using a Long Packet from the HOST to the driver IC. The content can include Command (No Parameters) or Command with 1 or more parameters.

#### **Display Command Set (DCS) Read, No Parameter, Data Type = 00 0110 (06h)**

Display Command Set (DCS) Read, No Parameter is always using a Short Packet, from the HOST to the driver IC. The HOST has to define to the driver IC, what is the maximum size of the return packet. A command, what is used for this purpose, is “Set Maximum Return Packet Size”, which Data Type is 11 0111 and which is using Short Packet before the HOST can send “Display Command Set (DCS) Read, No Parameter” to the driver IC.

**Null Packet, No Data , Data Type = 00 1001 (09h)**

Null Packet, No Data is always using a Long Packet, what is defined on Data Type from the HOST to the driver IC. The purpose of this command is keeping data lanes in the high speed mode, if it is needed. The driver IC is ignored Packet Data what the HOST is sending.

**Set Maximum Return Packet Size, Data Type = 11 0011 (37h)**

Set Maximum Return Packet Size is always using a Long Packet, what is defined on Data Type from the HOST to the driver IC. The purpose of this command is specifies the maximum size of the payload in a Long packet transmitted from peripheral back to the host processor.

**Sync Event (H Start, H End, V Start, V End), Data Type = XX 0001 (0xX1)**

Sync Events are Short packets and, therefore, can time-accurately represent events like the start and end of sync pulses. As “start” and “end” are separate and distinct events, the length of sync pulses, as well as position relative to active pixel data, The Sync Events are defined as follows:

- Data Type = 00 0001 (01h) V Sync Start
- Data Type = 01 0001 (11h) V Sync End
- Data Type = 10 0001 (21h) H Sync Start
- Data Type = 11 0001 (31h) H Sync End

**Color Mode On Command, and, Data Type = 01 0010 (12h)**

Color Mode On is a Short packet command that switches a Video Mode driver IC to 8-colors mode for power saving.

**Color Mode Off Command, Data Type = 00 0010 (02h)**

Color Mode Off is a Short packet command that returns a Video Mode driver IC from 8-colors mode to normal display operation.

**Shutdown Peripheral Command, Data Type = 10 0010 (22h)**

Shutdown Peripheral command is a Short packet command that turns off the display in a Video Mode driver IC for power saving. Note the interface shall remain powered in order to receive the turn-on, or wake-up command.

**Turn On Peripheral Command, Data Type = 11 0010 (32h)**

Turn On Peripheral command is Short packet command that turns on the display in a Video Mode driver IC for normal display operation.

**Blanking Packet (Long), Data Type = 01 1001 (19h)**

A Blanking packet is used to convey blanking timing information in a Long packet. Normally, the packet represents a period between active scan lines of a Video Mode display, where traditional display timing is provided from the host processor to the driver IC.

**Packed Pixel Stream, 16-bit Format, Long packet, Data Type = 00 1110 (0Eh)**

Packed Pixel Stream 16-Bit Format is a Long packet used to transmit image data formatted as 16-bit pixels to a Video Mode driver IC. Pixel format is five bits red, six bits green, five bits blue, in that order. Note that the “Green” component is split across two bytes. Within a color component, the LSB is sent first, the MSB last.

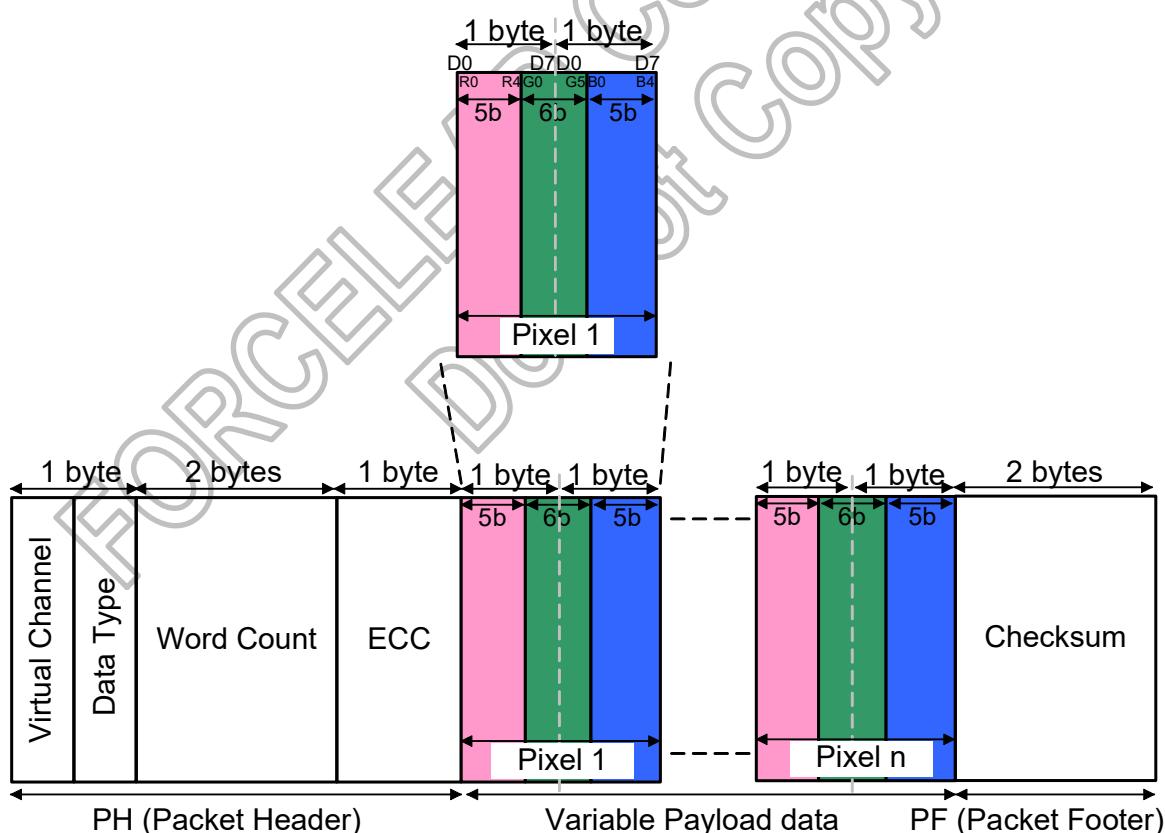

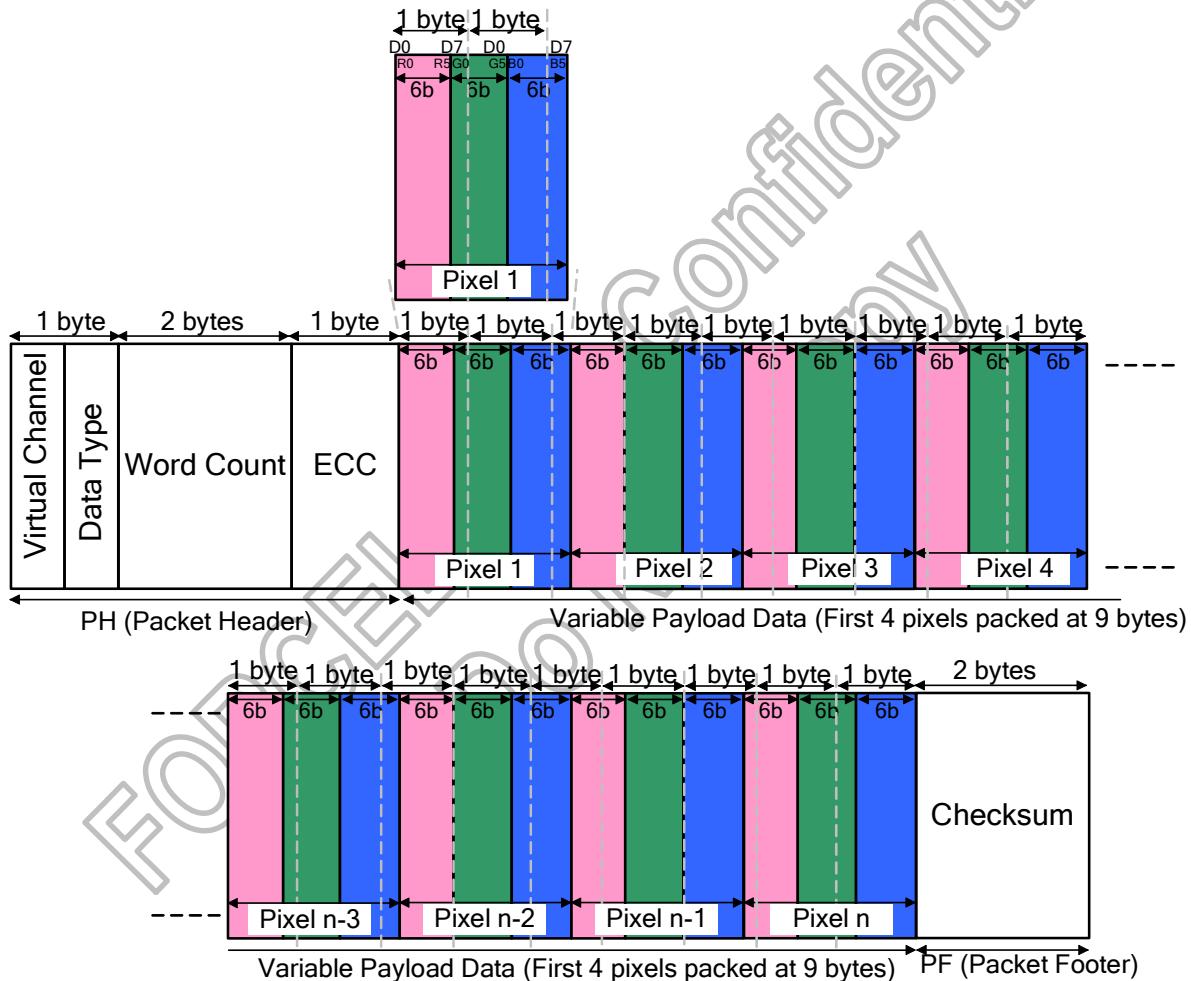

Figure 5-26: 16-bit RGB Color Format, Long packet

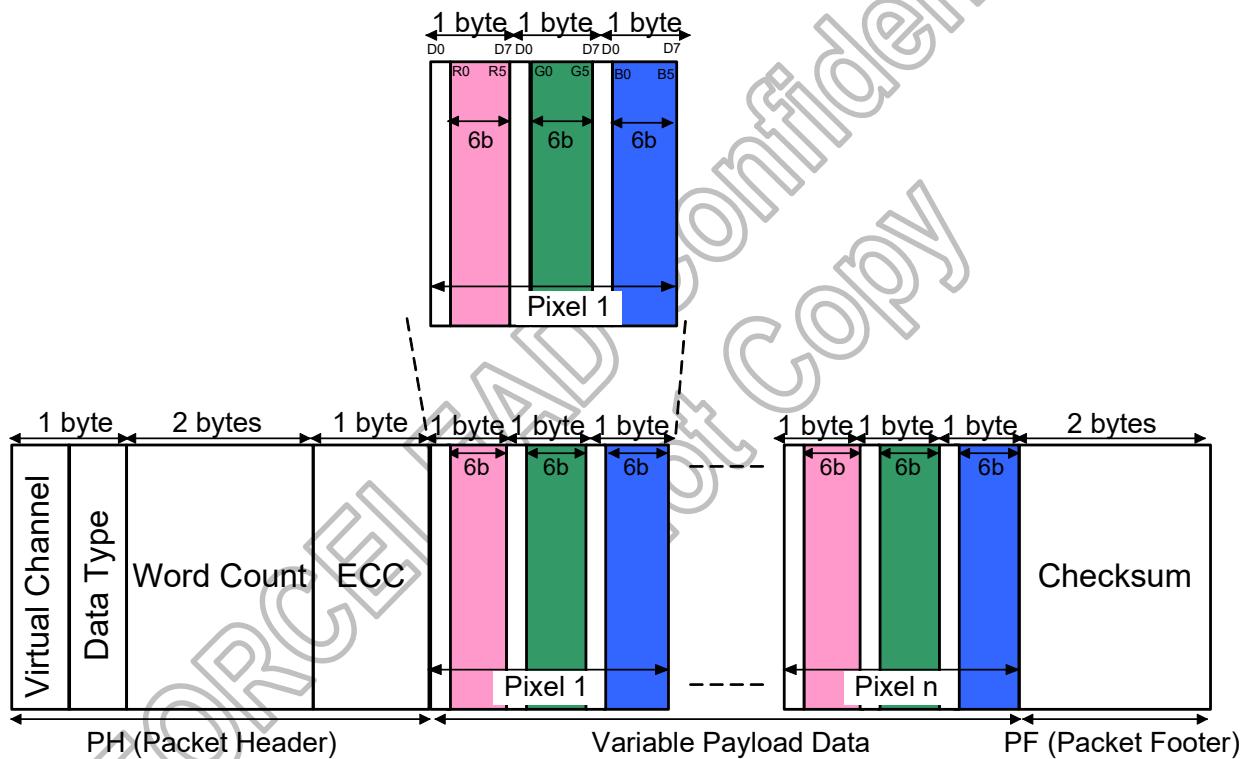

**Packed Pixel Stream, 18-bit Format, Long packet, Data type = 01 1110 (1Eh)**

Packed Pixel Stream 18-Bit Format is a Long packet used to transmit image data formatted as 18-bit pixels to a Video Mode driver IC. Pixel format is six bits red, six bits green, six bits blue, in that order.

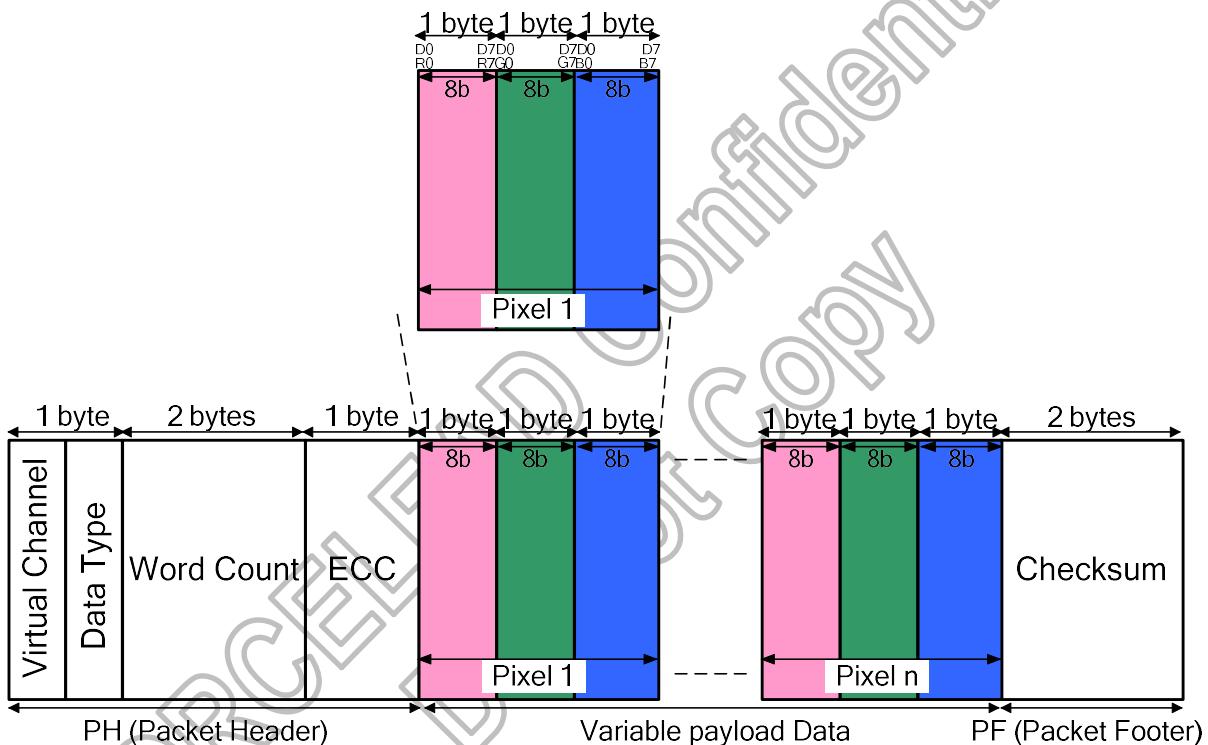

**Pixel Stream, 18-bit Format in Three Bytes, Long packet, Data Type = 101110 (2Eh)**

Packed Pixel Stream 18-Bit Format is a Long packet used to transmit image data formatted as 18-bit pixels to a Video Mode driver IC. Each R, G, or B color component is six bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored.

**Packed Pixel Stream, 24-bit Format, Long packet, Data Type = 11 1110 (3Eh)**

Packed Pixel Stream 24-Bit Format is a Long packet used to transmit image data formatted as 18-bit pixels to a Video Mode driver IC. Pixel format is eight bits red, eight bits green, eight bits blue, in that order.

**Acknowledge with Error Report, Data Type = 00 0010(02h)**

“Acknowledge with Error Report” is always using a Short Packet, from the driver IC to the HOST. The Packet Data can include bits, which are defining the current error, when a corresponding bit is set to ‘1’, as they are defined on the following table.

Bit	Description
0	SoT Error
1	SoT Sync Error
2	EoT Sync Error
3	Escape Mode Entry Command Error
4	Low-Power Transmit Sync Error
5	HS Receive Timeout Error
6	Reserved
7	Reserved
8	ECC Error, single-bit (detected and corrected)
9	ECC Error, multi-bit (detected, not corrected)
10	Checksum Error (long packet only)
11	DSI Data Type Not Recognized
12	DSI VC ID Invalid
13	Reserved
14	Reserved
15	Reserved

These errors of the previous packets can check “Read Display Signal Mode (0Eh)” and “Read Number of the Errors on DSI (05h)” commands. The bit D0 of the “Read Display Signal Mode (0Eh)” command has been set to ‘1’ if a received packet includes an error.

The number of the packets, which are including an ECC or CRC error, are calculated on the RDNUMED register, which can read “Read Number of the Errors on DSI (05h)” command.

**DCS Read Long Response, Data Type = 01 1100(1Ch)**

DCS Read Long Response is always using a Long Packet, from the driver IC to the Host. “DCS Read Long Response” is used when the driver IC wants to response a DCS Read command, which the Host has sent to the driver IC.

**DCS Read Short Response, 1 Byte Returned, Data Type = 10 0001(21h)**

DCS Read Short Response, 1 Byte Returned is always using a Short Packet from the driver IC to the Host. “DCS Read Short Response, 1 Byte Returned” is used when the driver IC wants to response a DCS Read command, which the Host has sent to the driver IC.

**DCS Read Short Response, 2 Bytes Returned, Data Type = 10 0010(22h)**

DCS Read Short Response, 2 Bytes Returned is always using a Short Packet from the driver IC to the Host. “DCS Read Short Response, 2 Bytes Returned” is used when the driver IC wants to response a DCS Read command, which the Host has sent to the driver IC.

**Generic Read Long Response, Data Type = 01 1010(1Ah)**

Generic Read Long Response is always using a Long Packet from the driver IC to the HOST. "Generic Read Long Response" is used when the driver IC wants to response a Generic Read command.

**Generic Read Short Response, 1 Byte Returned, Data Type = 01 0001(11h)**

Generic Read Short Response, 1 Byte Returned is always using a Short Packet from the driver IC to the HOST. "Generic Read Short Response, 1 Byte Returned" is used when the driver IC wants to response a Generic Read command, which the HOST has sent to the driver IC.

**Generic Read Short Response, 2 Bytes Returned, Data Type = 01 0010(12h)**

Generic Read Short Response, 2 Bytes Returned is always using a Short Packet from the driver IC to the HOST. "Generic Read Short Response, 2 Bytes Returned" is used when the driver IC wants to response a Generic Read command, which the HOST has sent to the driver IC.

### 5.3 Inversion

The FL7707N can support the column, 1-dot, 1+2-dot, 2-dot, 3-dot, 4-dot and 8-dot inversion of liquid crystal. These inversions can provide a solution for improving display quality. In determining the inversion drive for the inversion cycle, check the quality of display on the liquid crystal panel.

The FL7707N also can support the ZigZag inversion. Eight kinds of ZigZag inversion can be selected by software setting. These kinds are as below figure:

FORCELEAD

FL7707N

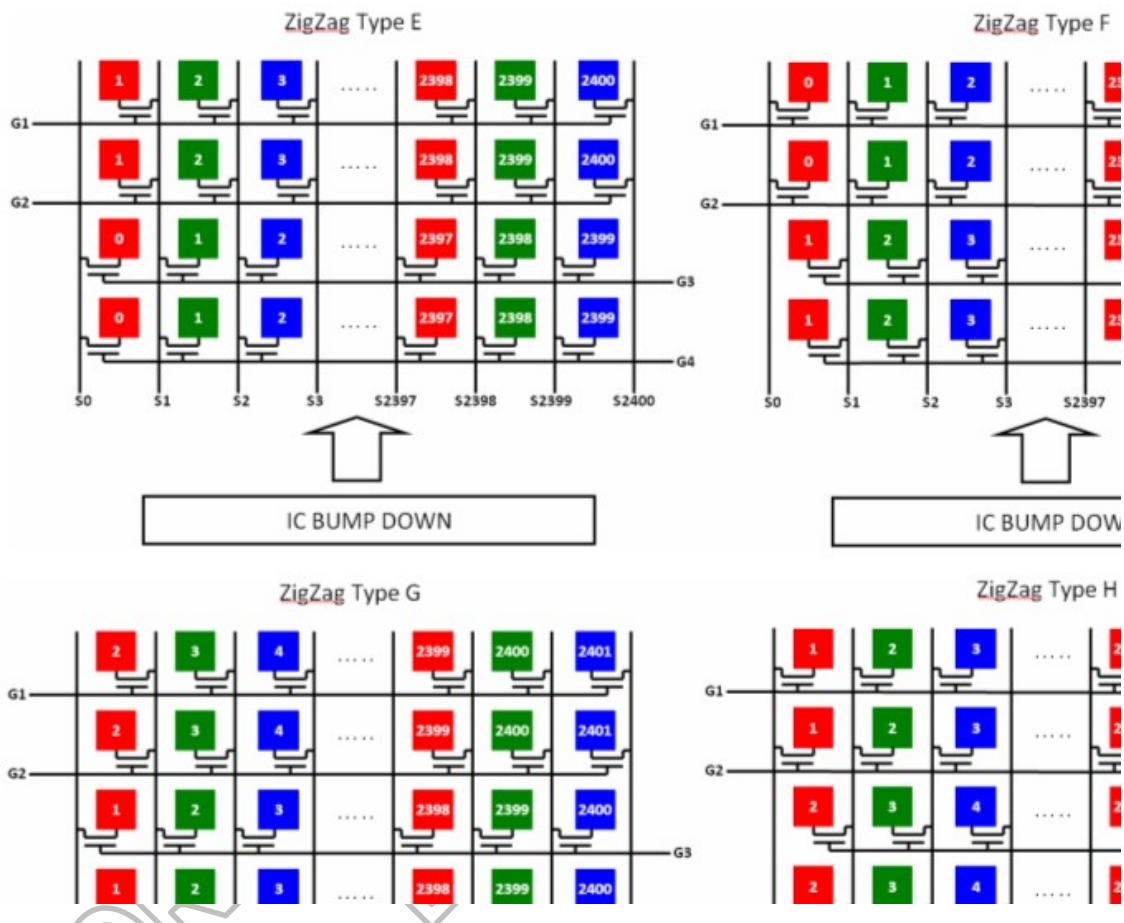

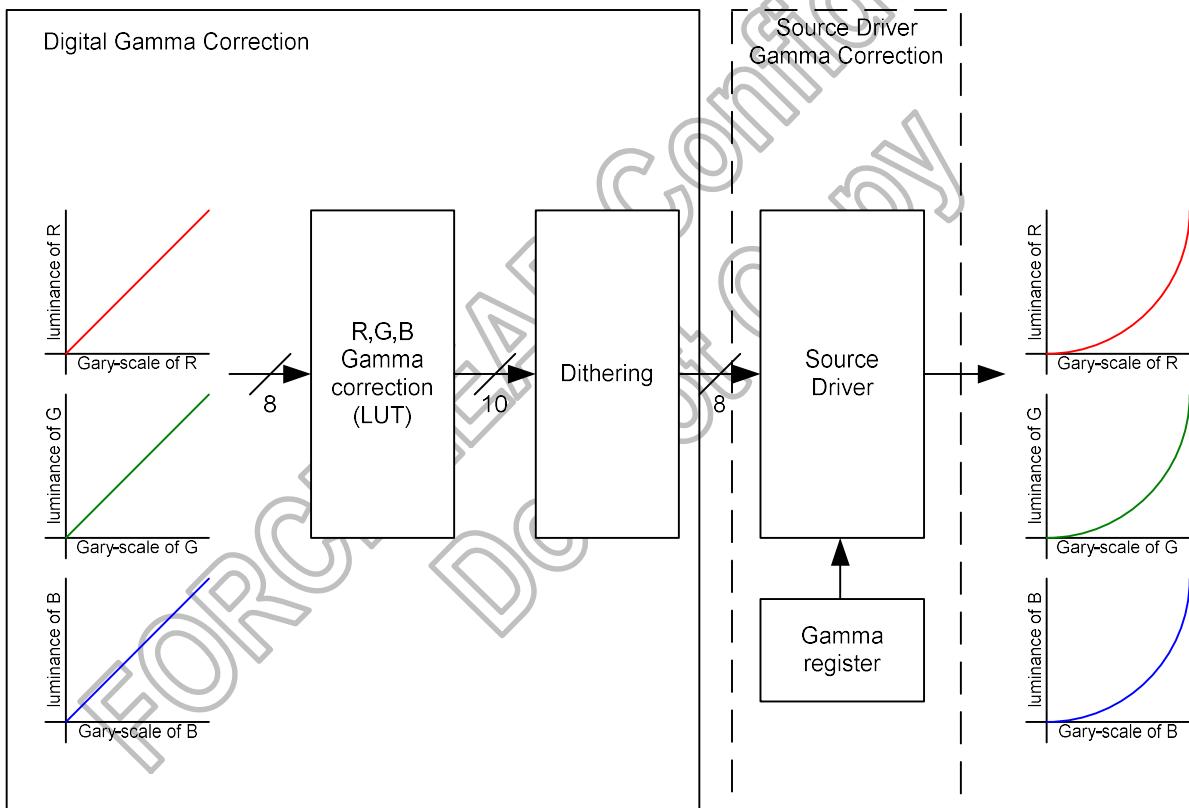

Figure 5-27: Source channels of ZigZag inversion mode

## 5.4 Gamma Function

The FL7707N offers two kinds of Gamma adjustment ways to come to accord with LC characteristic, one kind is through Source Driver directly, another one is adjusted by the digital gamma correction. The adjustment of digital gamma is selected by internal register DGC\_EN bit.

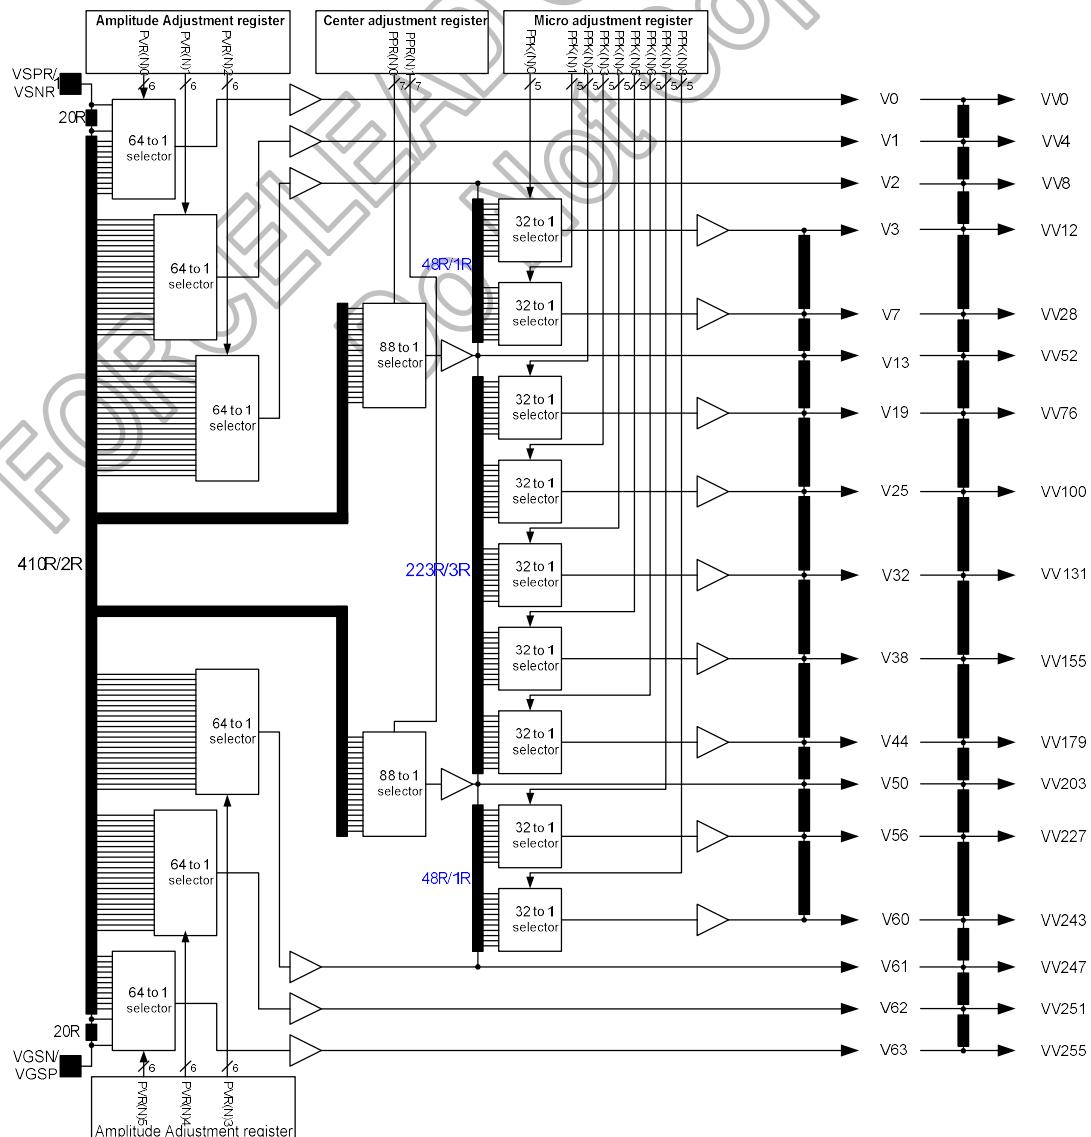

**Figure 5-28: Gamma adjustments different of source driver with digital gamma correction**

### 5.4.1 Gamma Characteristic Correction Function

The FL7707N incorporates gamma adjustment function for the 16.7m-color display. Gamma adjustment operation is implemented by deciding the 17 grayscale levels firstly in gamma adjustment control registers to match the LCD panel. These registers are available both for positive polarities and negative polarities.

The block consists of two gamma register streams one is for positive polarity and the other is for negative polarity, each one including 17 gamma reference voltages. VgP/N (0, 4, 8, 12, 28, 52, 76, 100, 131, 155, 179, 203, 227, 273, 247, 251, 255).

### 5.4.2 Gray Voltage Generator for Digital Gamma Correction

The FL7707N digital gamma correction can reach the independent GAMMA curve of RGB. The FL7707N utilizes DGC\_LUT (Digital Gamma Correction Look Up Table) to change input data from 8-bit into 10-bit and sends 10-bit data to Dithering circuit, and then drive Source Driver via Dithering circuit. The following of the block diagram of the function.

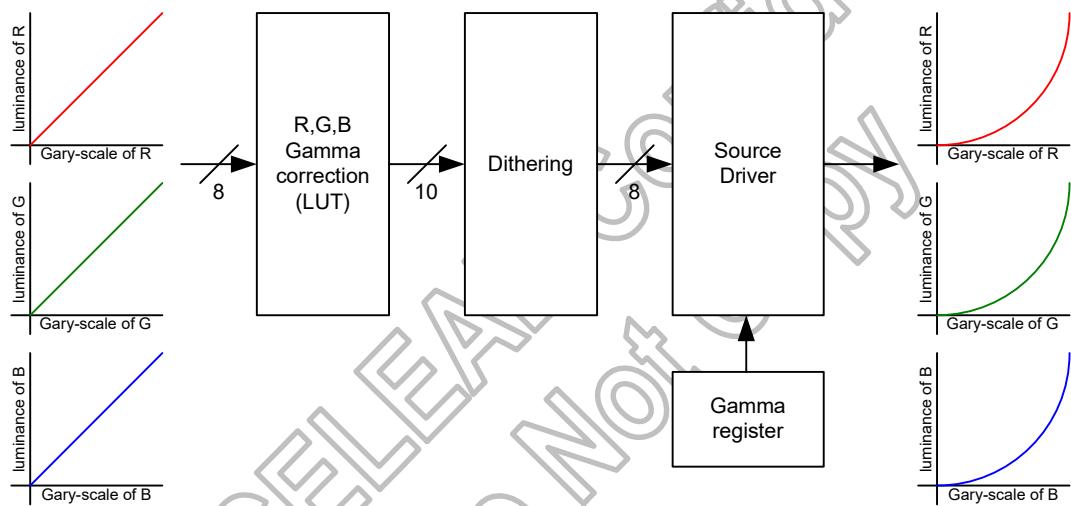

Figure 5-29: Block diagram of digital gamma correction

FORCELEAD

a-Si TFT LCD Single Chip Driver  
720RGB x 2047 dot with 16.7M color

FL7707N

There are 99 bytes DGC LUT to set R, G, B gamma independently. When DGC\_EN=1, R, G, B gamma will mapping V0, V8, V16, ..., V240, V248, V255 voltage to the LUT register setting gray level voltage.

## 5.5 Sleep Out - command and Self-diagnostic Functions of the display module

### 5.5.1 Register Loading Detection

Sleep Out-command (11h) is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from OTP (or similar device) to registers of the display controller is working properly. There are compared factory values of the OTP and register values of the display controller by the display controller. If those both values (OTP and register values) are same, there is inverted (=increased by 1) a bit, which is defined in command "Read Display Self-Diagnostic Result (0Fh)" (=RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (=increased by 1).

The flow chart for this internal function is following:

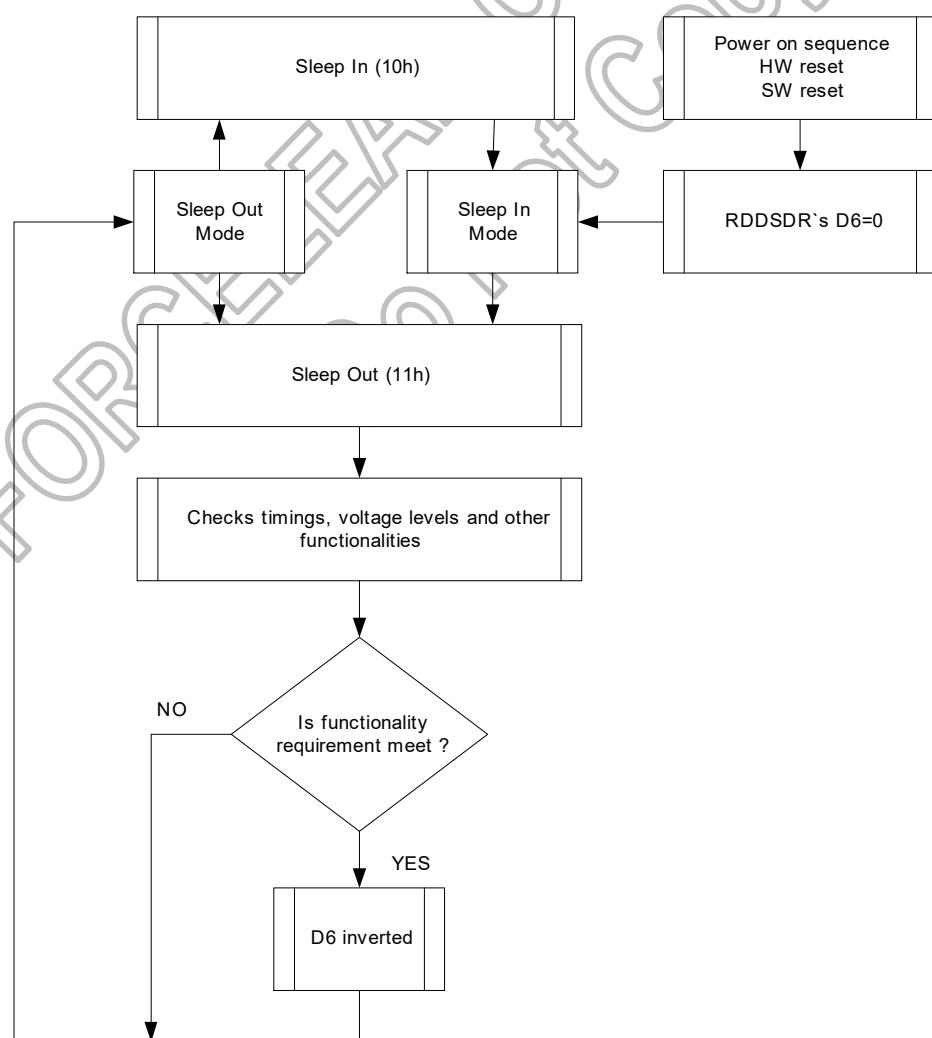

**Figure 5-30: Sleep out flow chart—command and self-diagnostic functions**

### 5.5.2 Functionality Detection

Sleep Out-command (11h) is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function is comparing, if the display module still meets functionality requirements (e.g. booster voltage levels, timings, etc.). If functionality requirement is met, 1 bit will be inverted (=increased by 1), which is defined in command “Read Display Self-Diagnostic Result (0Fh)” (=RDDSDR) (The used bit of this command is D6). If functionality requirement is not the same, this bit (D6) is not inverted (=increased by 1). The flow chart for this internal function is shown as below.

**Figure 5-31: Sleep out flow chart internal function detection**

## 5.6 Power on/off Sequence

Power source IOVCC, VCI can be applied and powered down in any order. IOVCC, VCI can be powered down in any order.

During power off, if LCD is in the Sleep Out mode, IOVCC, VCI must be powered down minimum 120msec after NRESET has been released.

During power off, if LCD is in the Sleep In mode, IOVCC, VCI can be powered down minimum 0msec after NRESET has been released.

NCS can be applied at any timing or can be permanently grounded. NRESET has priority over NCS.

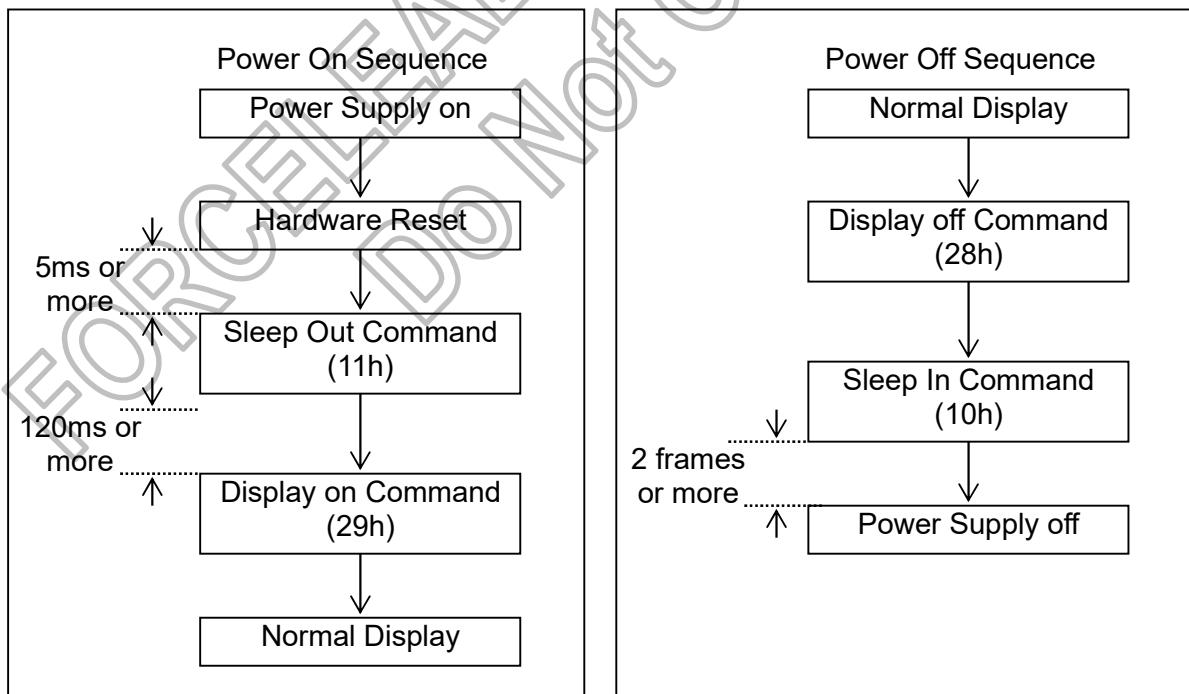

Figure 5-32: The power supply ON/OFF setting for Display ON/OFF and Sleep In/out

### 5.6.1 Case 1: RESX line is held high or unstable by host at power on

If RESX line is held high or unstable by the host during power on, then a Hardware Reset must be applied after both VDD1, VDD2 and VDD3 have been applied- otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

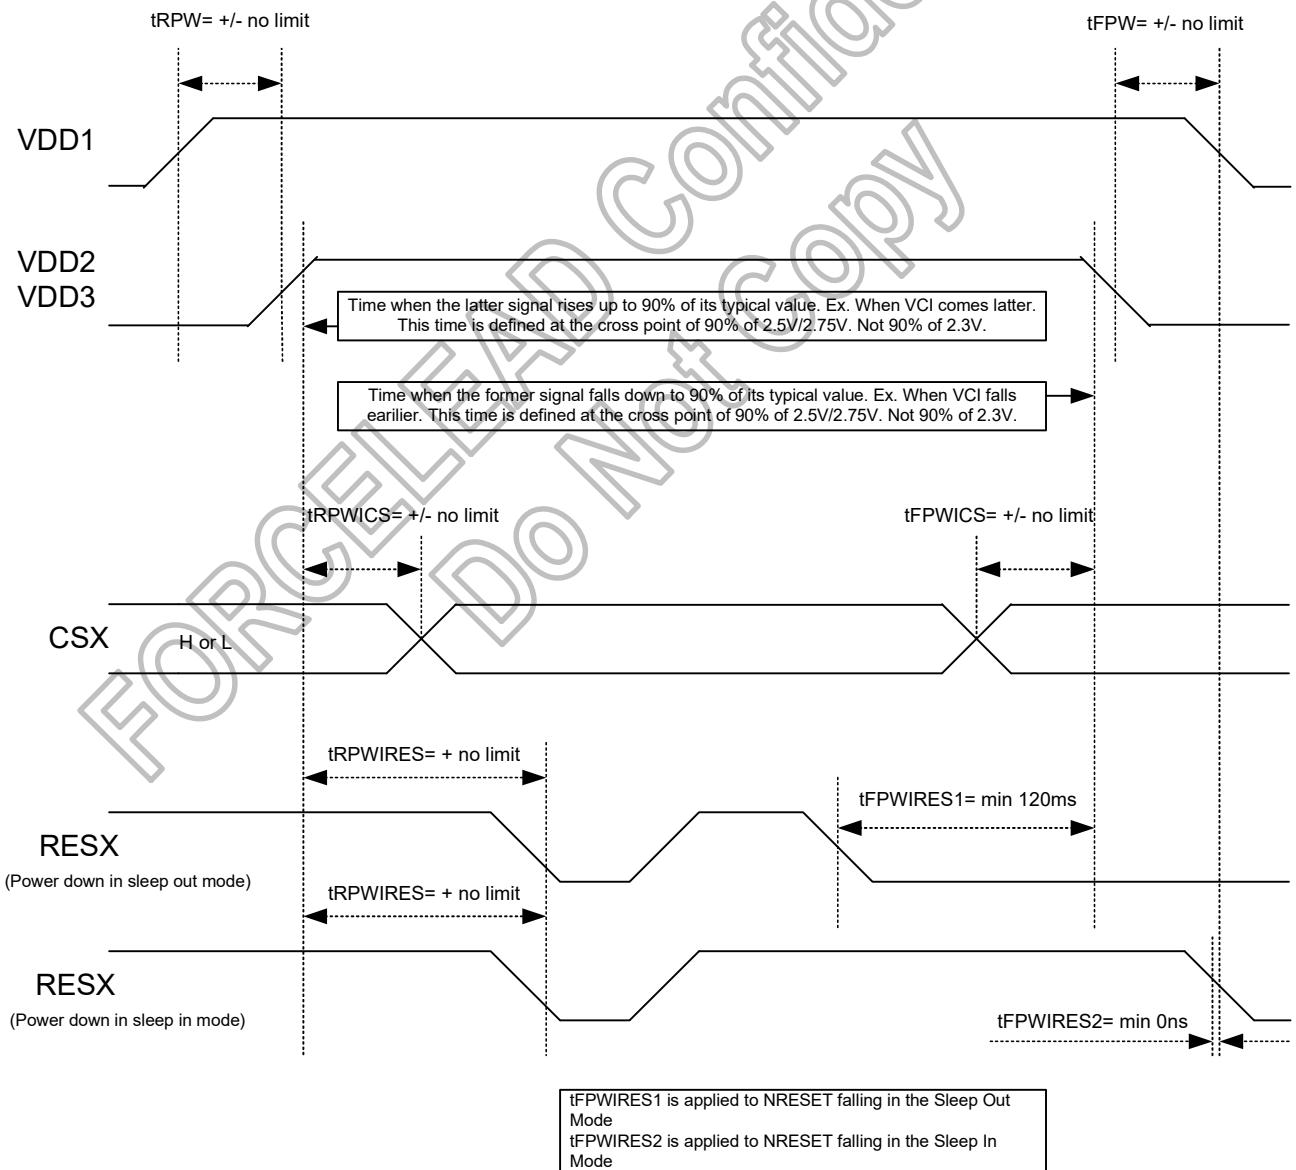

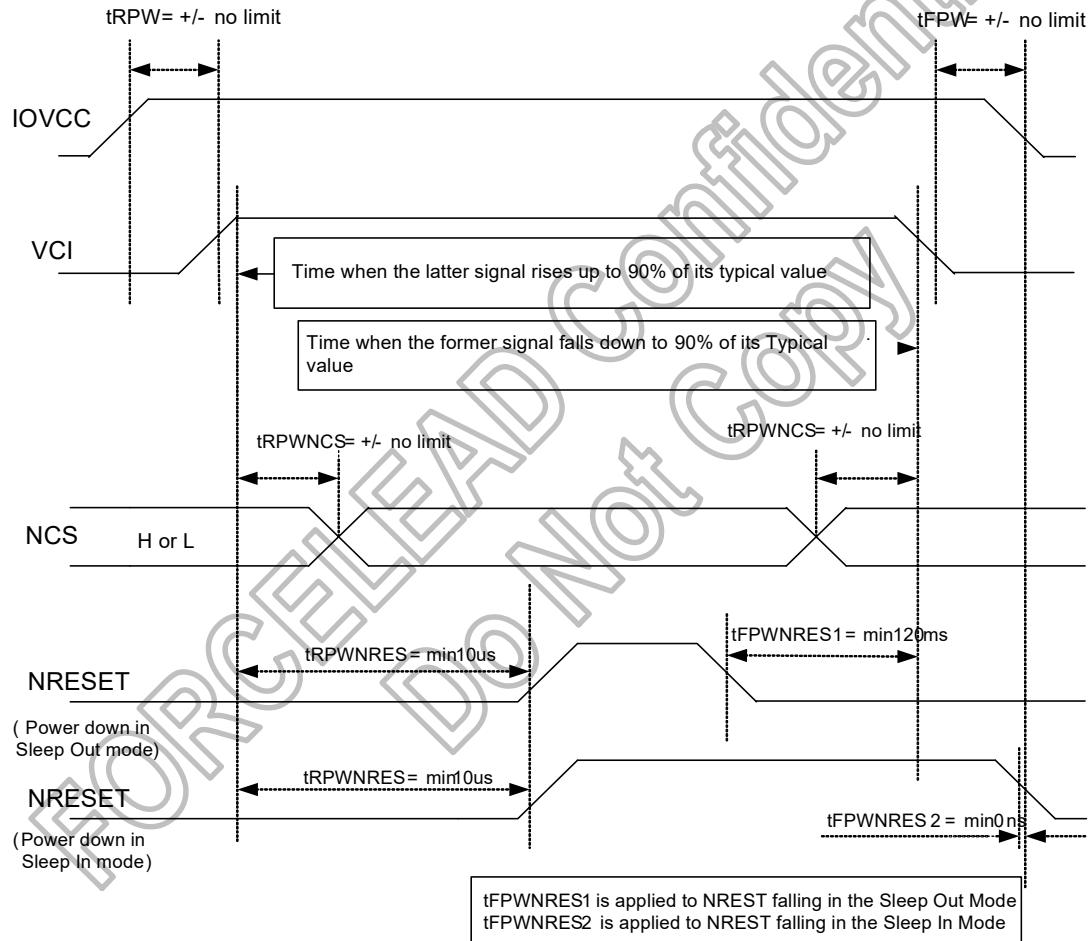

Figure 5-33: Case 1: RESX line is held high or unstable by host at power on

### 5.6.2 Case 2: RESX line is held low by host at power on

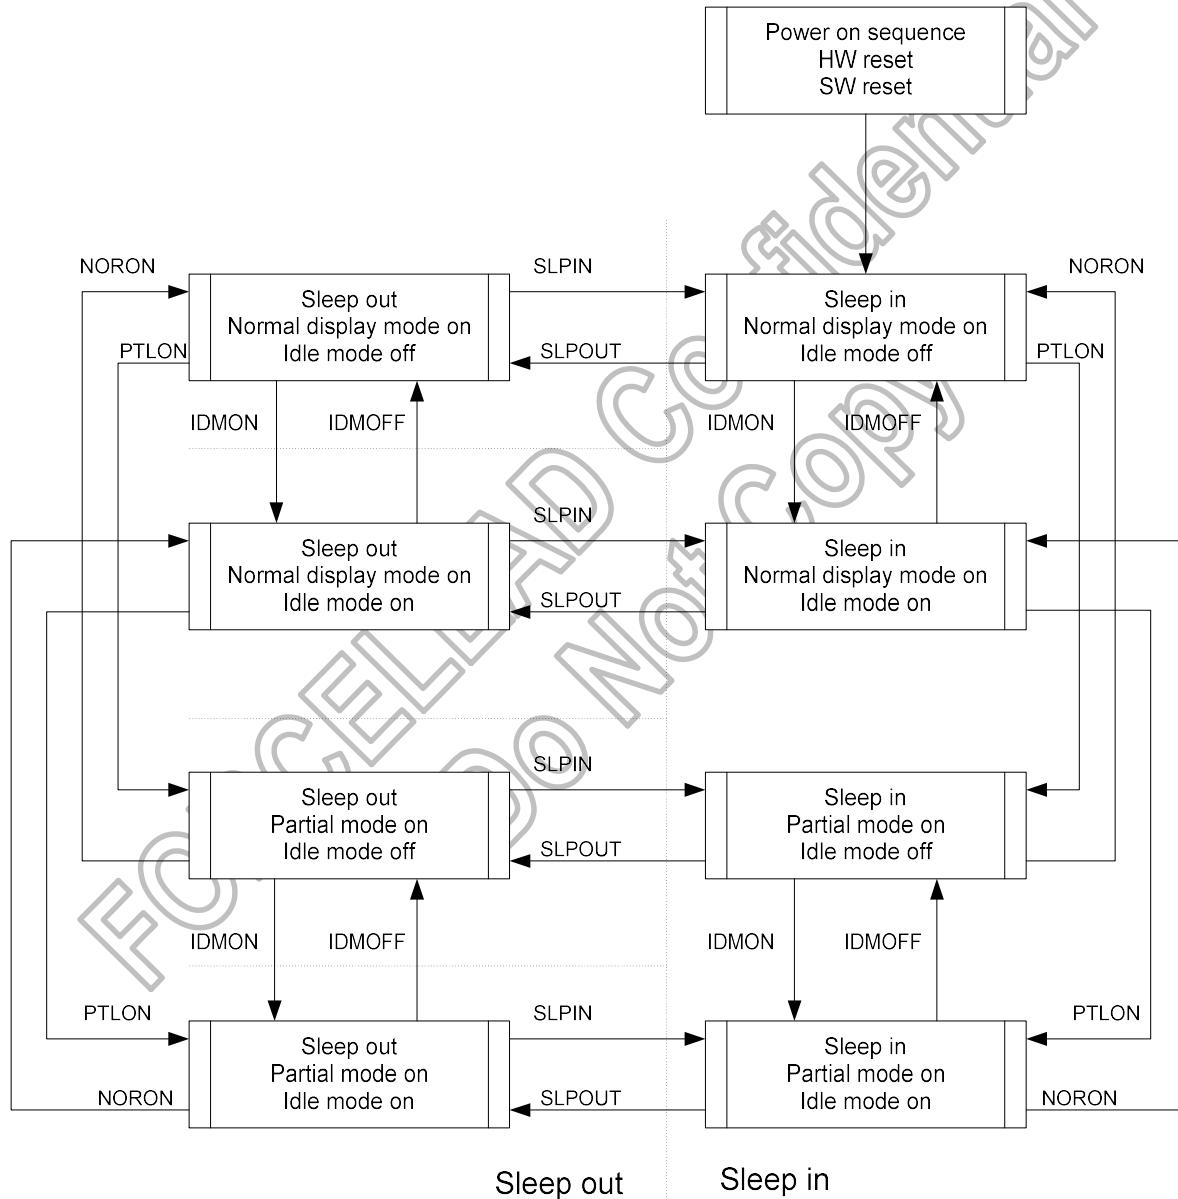

If RESX line is held low (and stable) by the host during power on, then the RESX must be held low for minimum 10 $\mu$ sec after both VDD1, VDD2 and VDD3 have been applied.

Note: Unless otherwise specified timings herein show cross point at 50% of signal/power level

**Figure 5-34: Case 2: RESX line is held low by host at power on**

## 5.7 Power Levels Definition

## 5.10 CABC

This driver IC provides a dynamic backlight control function as CABC (Content adaptive brightness control) to reduce the power consumption of the luminance source. There are two module architectures for CABC operation as below figure.

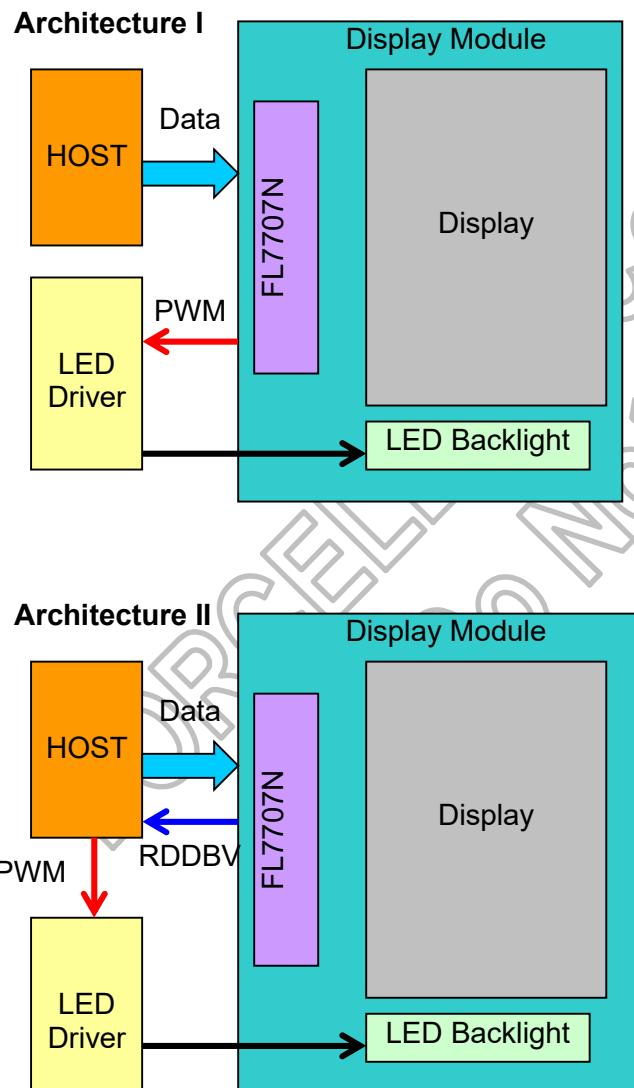

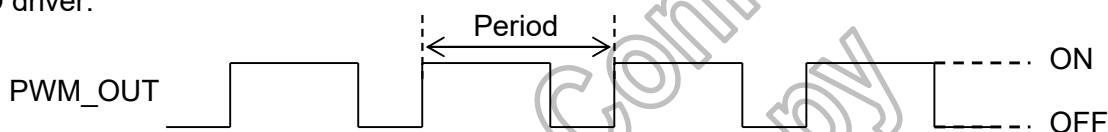

Figure 5-36: Two kinds of CABC Architecture

The driver IC will refer the gray scale content of display image to output a PWM waveform to LED driver for backlight brightness control. The PWM frequency can be adjusted by PWM\_DIV parameters and the calculating equation as below:

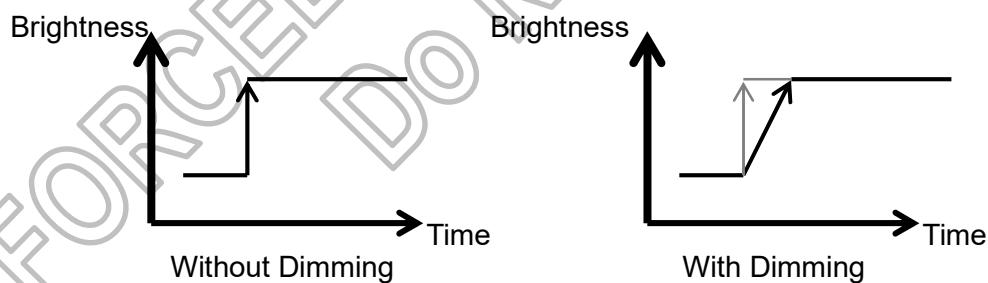

$$F_{\text{pwm\_out}} = \frac{36\text{MHz} / (2^{\text{PWMDIV}[2:0]})}{(\text{PWM\_PERIOD}[7:0]+1) \times 255}$$

The figure in the following is the basic timing diagram which is applied FL7707N to control LED driver.

### Display Backlight Dimming Control

A dimming function is used when changing from brightness level to another. This dimming function curve is the same in increment and decrement directions. Dimming function can be enabled and disabled by software register. The basic idea is described below.

## 6. Command Description

### 6.1 Command Table

### 6.2.2 Software reset (01h)

01 H		SWRESET (Software Reset)																					
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX													
Command	Write	0	0	0	0	0	0	0	1	01													
Parameter	NO PARAMETER																						
Description	When the Software Reset command is written, it causes a software reset. It resets the commands and parameters to their S/W Reset default values. (See default tables in each command description.) The display is blank immediately.																						
Restriction	It will be necessary to wait 5msec before sending new command following software reset. The display module loads all display suppliers' factory default values to the registers during this 5m sec. If SW Reset is applied during Sleep Out mode, it will be necessary to wait 120m sec before sending Sleep Out command. SW Reset command cannot be sent during Sleep Out sequence.																						
Register Availability	<table border="1"> <thead> <tr> <th>Status</th> <th>Availability</th> </tr> </thead> <tbody> <tr> <td>Normal Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Normal Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Sleep In or Booster Off</td> <td>Yes</td> </tr> </tbody> </table>		Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In or Booster Off	Yes

### 6.2.11 Sleep Out (11h)

11 H		SLPOUT (Sleep Out)																					
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX													
Command	Write	0	0	0	1	0	0	0	1	11													
Parameter	No Parameter																						
Description	<p>This command turns off sleep mode. In this mode the DC/DC converter is enabled, Internal display oscillator is started, and panel scanning is started.</p> <p>The diagram illustrates the state changes of various components upon exiting sleep mode. The 'Internal Oscillator' goes from STOP to Start. Three 'DC/DC Converter' lines transition from 0V to a higher level. The 'Gate Output' goes from STOP to a high-frequency square wave. The 'Source Output' and 'VCOM Output' both transition from 0V to a high level, which is labeled as 'Memory Contents'. A note indicates 'Blanking display (over 1frame display)' at this high level. If the bit DISPON (29H) is set, the memory contents are maintained.</p>																						
Restriction	<p>This command has no effect when module is already in sleep out mode. Sleep Out Mode can only be left by the Sleep In Command (10h). It will be necessary to wait 5msec before sending next command, this is to allow time for the supply voltages and clock circuits to stabilize.</p> <p>The display module loads all display supplier's factory default values to the registers during this 15msec and there cannot be any abnormal visual effect on the display image if factory default and register values are same when this load is done and when the display module is already Sleep Out -mode.</p> <p>The display module is doing self-diagnostic functions during this 5msec.</p> <p>It will be necessary to wait 120msec after sending Sleep In command (when in Sleep Out mode) before Sleep Out command can be sent.</p>

#### Description

- **VSP\_FBon:** Enable VSP Feedback Function.

- 1: Enable VSP feed back function
- 0: Disable VSP feed back function

- **SINGLE\_PUMP:** Specify signal pump state.

- 1: VCSW1 Toggle; VSCW2 GND.
- 0: VCSW1 / VCSW2 Toggle.

- **DT[1:0]:** Specify VCSW1/VCSW2 soft start time.

DT[1:0]	Period (ms)
0	5
1	10
2	15
3	20

- **SYNC\_STB:** Enter synchronous standby mode.

- 1: All power signal synchronous turn off.
- 0: All power signal sequence turn off.

FORCELEAD

a-Si TFT LCD Single Chip Driver  
720RGB x 2047 dot with 16.7M color

- **XDK\_ECP[1:0]:** Specify Pumping ratio of VSP / VSN with VCI.

XDK_ECP[1:0]	Ratio
0	X1.5
1	X2
2	X3
3	Setting Inhibited

- **PFM\_DC\_DIV[2:0]:** Specify PFM operation frequency FoscD.

PFM_DC_DIV[2:0]	FoscD
0	Fosc/1
1	Fosc/2
2	Fosc/3
3	Fosc/4
4	Fosc/5
5	Fosc/6
6	Fosc/7
7	Fosc/8

- **ECP\_SYNC\_EN:** Enable power IC pumping frequency synchronization.

- 1: Synchronize with external Hsync.
- 0: Synchronize with internal Hsync.

- **VGX\_SYNC\_EN:** Enable VGH/VGL pumping frequency synchronization.

- 1: Synchronize with external Hsync.
- 0: Synchronize with internal Hsync.

- **A\_DC[1:0]:** Specify PFM operation half period.

A_DC[1:0]	Period
0	4/FoscD
1	6/FoscD
2	8/FoscD
3	12/FoscD

- **A\_DTP[2:0]:** Specify PFM period of VSP.

- **A\_DTN[2:0]:** Specify PFM period of VSN.

- **DTPS[2:0]:** Specify PFM period of VSP at soft start stage.

- **DTNS[2:0]:** Specify PFM period of VSN at soft start stage.

DTN[2:0]	Period
0	1/FoscD
1	2/FoscD
2	3/FoscD
3	4/FoscD
4	5/FoscD
5	6/FoscD
6	7/FoscD
7	8/FoscD

- **DCS[1:0]:** Specify PFM operation half period at soft start stage.

DCS[1:0]	Period
0	12/FoscD
1	24/FoscD
2	48/FoscD
3	60/FoscD

This command is used to set MIPI related register.

- **VC\_Main [1:0]:** Specify the virtual channel ID for multiple slave ID.
- **Lane [1:0]:** Specify the lane number selection.

Lane[1:0]	MIPI Lane
0	1 lane
1	2 lanes
2	3 lanes
3	4 lanes

- **DSI\_LDO\_SEL[2:0]:** Specify the MIPI LDO voltage selection.

DSI_LDO_SEL[2:0]	LDO voltage (V)	DSI_LDO_SEL[2:0]	LDO voltage (V)
0	1.4	4	1.7
1	1.45	5	1.8
2	1.5	6	1.9
3	1.6	7	2.0

- **RTERM[1:0]:** Specify the terminal resistance

RTERM [1:0]	Resistance ( $\Omega$ )
0	110
1	100
2	90
3	80

- **IHSRX[3:0]:** Specify the MIPI Low High Speed driving ability .

IHSRX [3:0]	Driving Ability	IHSRX [3:0]	Driving Ability
0	X1	8	X9
1	X2	9	X10
2	X3	10	X11
3	X4	11	X12
4	X5	12	X13
5	X6	13	X14
6	X7	14	X15
7	X8	15	X16

- **Tx\_clk[1:0]:** Specify TXCLK speed in DSI LP mode for transmission.

Tx_clk[1:0]	TXCLK
0	fDSICLK/4
1	fDSICLK/8
2	fDSICLK/16
3	fDSICLK/32

- **HFP\_OSC[7:0]:** Specify the min. HFP number in DSI mode.

- **HBP\_OSC[7:0]:** Specify the min. HBP number in DSI mode.

### 6.2.63 SETID (C3h)

C3 H	SETID																					
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	W	1	1	0	0	0	0	1	1	C3												
Parameter 1st	R/W	ID1[7]	ID1[6]	ID1[5]	ID1[4]	ID1[3]	ID1[2]	ID1[1]	ID1[0]	38												
Parameter 2nd	R/W	ID2[7]	ID2[6]	ID2[5]	ID2[4]	ID2[3]	ID2[2]	ID2[1]	ID2[0]	21												
Parameter 3rd	R/W	ID3[7]	ID3[6]	ID3[5]	ID3[4]	ID3[3]	ID3[2]	ID3[1]	ID3[0]	1F												
Parameter 4th	R	x	x	x	x	x	ID_TIME[2]	ID_TIME[1]	ID_TIME[0]	00												
Description	This command is used for setting ID.  • <b>ID1[7:0] / ID2[7:0] / ID3[7:0]:</b> Set ID1 / ID2 / ID3 respectively - 04h / DAh / DBh / DEh change correspondingly  • <b>ID_TIME[2:0]:</b> Read ID OTP programming times. <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <th>ID_TIME[2:0]</th> <th>OTP Programming times</th> </tr> <tr> <td>0</td> <td>NO OTPED</td> </tr> <tr> <td>1</td> <td>1</td> </tr> <tr> <td>2</td> <td>2</td> </tr> <tr> <td>3</td> <td>3</td> </tr> <tr> <td>4</td> <td>4</td> </tr> </table>										ID_TIME[2:0]	OTP Programming times	0	NO OTPED	1	1	2	2	3	3	4	4
ID_TIME[2:0]	OTP Programming times																					
0	NO OTPED																					
1	1																					
2	2																					
3	3																					
4	4																					

### 6.2.64 SETDDB (C4h)

C4 H	SETDDB									
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	W	1	1	0	0	0	1	0	0	C4
Parameter 1st	R/W	DDB1[7]	DDB1[6]	DDB1[5]	DDB1[4]	DDB1[3]	DDB1[2]	DDB1[1]	DDB1[0]	00
Parameter 2nd	R/W	DDB2[7]	DDB2[6]	DDB2[5]	DDB2[4]	DDB2[3]	DDB2[2]	DDB2[1]	DDB2[0]	00
Parameter 3rd	R/W	DDB3[7]	DDB3[6]	DDB3[5]	DDB3[4]	DDB3[3]	DDB3[2]	DDB3[1]	DDB3[0]	00
Parameter 4th	R/W	DDB4[7]	DDB4[6]	DDB4[5]	DDB4[4]	DDB4[3]	DDB4[2]	DDB4[1]	DDB4[0]	00
Description	This command is used to set CMD DDB1~4 value.  • <b>DDB1[7:0] ~ DDB4[7:0]:</b> Set DDB1 ~ DDB4.									

### 6.2.65 SETECO (C6h)

C6 H	SETECO									
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	W	1	1	0	0	0	1	1	0	C6
Parameter 1st	R/W	ECO0[7]	ECO0[6]	ECO0[5]	ECO0[4]	ECO0[3]	ECO0[2]	ECO0[1]	ECO0[0]	01
Parameter 2nd	R/W	ECO1[7]	ECO1[6]	ECO1[5]	ECO1[4]	ECO1[3]	ECO1[2]	ECO1[1]	ECO1[0]	00
Parameter 3rd	R/W	ECO2[7]	ECO2[6]	ECO2[5]	ECO2[4]	ECO2[3]	ECO2[2]	ECO2[1]	ECO2[0]	CF
Parameter 4th	R/W	ECO3[7]	ECO3[6]	ECO3[5]	ECO3[4]	ECO3[3]	ECO3[2]	ECO3[1]	ECO3[0]	FF
Parameter 5th	R/W	ECO4[7]	ECO4[6]	ECO4[5]	ECO4[4]	ECO4[3]	ECO4[2]	ECO4[1]	ECO4[0]	00
Parameter 6th	R/W	ECO5[7]	ECO5[6]	ECO5[5]	ECO5[4]	ECO5[3]	ECO5[2]	ECO5[1]	ECO5[0]	FF
Description	This command is used to control ECO register.									

### 6.2.66 SETIO (C7h)

C7 H	SETIO									
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	W	1	1	0	0	0	1	1	1	C7

## Description

- **ESD\_DET\_DATA\_WHITE:** Select white or black pattern to protect GOA glass.
- **ESD\_WHITE\_EN:** Enable ESD detection function to protect GOA glass.
  - At Sleep-Out State, IC automatically displaying white or black pattern when MIPI-DSI is interrupted or not sent.
- **SLPIN\_OPTION**
  - 0: Need VSYNC (additional frame) after Sleep-In command to display sleep-in blanking frame then into Sleep-In State.
  - 1: No Need VSYNC (additional frame) after Sleep-In command to display sleep-in blanking frame then into Sleep-In State.
- **VEDIO\_NO\_CHECK\_EN:** Enable video function detection.
  - 0: Enable vedio function detection.
  - 1: Disable vedio function detection, continually displaying white or black pattern after sleep-out blanking frame without detecting if MIPI video comes or not
- **ESD\_WHITE\_GND\_EN:** Enable ESD white pattern scanning voltage pull ground.  
“0”, Disable scanning voltage pull ground.  
“1”, Enable scanning voltage pull ground.
- **ESD\_DET\_TIME\_SEL[1:0]:** ESD detection function period.

ESD_TIME_SEL[1:0]	Period
0	1 frames
1	2 frames
2	4 frames
3	8 frames

FL7707N

This command is to set forward GIP timing.

• **REF\_EN:**

- 0: SHR0, SHR1, CHR, CHR2 refer to Internal VSYNC
- 1: SHR0, SHR1, CHR, CHR2 refer to Internal DE
  - ◎ REF\_EN=1: SHR0, SHR1, CHR, CHR2 = MSB Sign Bit.

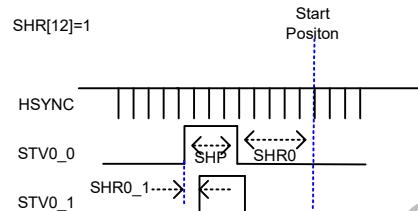

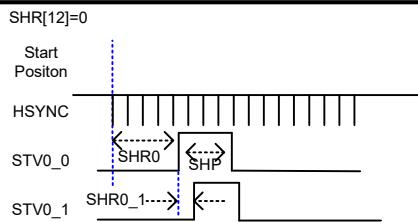

• **PANEL\_SEL[3:0]:** Specify GIP signal at abnormal power off state.

Panel_sel[3:0]	GIP signal State
1	GND
2	VGH2 (VSP)
4	VGL
8	VGH

Description

• **PANEL\_SEL\_INI[3:0]:** Specify GIP signal at initial state.

PANEL_SEL_INI	GIP signal State
1	VGH2
2	VGH
4	VGL
8	GND

- **SHR0[12:0]**: Specify the starting position of GIP STV group 0 (STV0\_0).
- **SHR1[12:0]**: Specify the starting position of GIP STV group 1 (STV1\_0).

<b>SHR0[12:0] SHR1[12:0] (Hex)</b>	<b>Starting Position</b>
0	0 HSYNC
1	1 HSYNC
2	2 HSYNC
:	:
FFF	4095 HSYNC

- **SPON[9:0]**: Specify the distance of STV rising edge and HYSNC.
- **SPOFF[9:0]**: Specify the distance of STV falling edge and HYSNC.

<b>SPON[9:0] SPOFF[9:0] (Hex)</b>	<b>Distance</b>
0	0*(2/Fosc)
1	1*(2/Fosc)
2	2*(2/Fosc)
:	:
3FF	1023*(2/Fosc)

- **SHR0\_1[3:0] / SHR0\_2[3:0] / SHR0\_3[3:0]**: Specify the STV0\_x distance with STV0\_0.
- **SHR1\_1[3:0] / SHR1\_2[3:0] / SHR1\_3[3:0]**: Specify the STV1\_x distance with STV1\_0. (X=1~3)

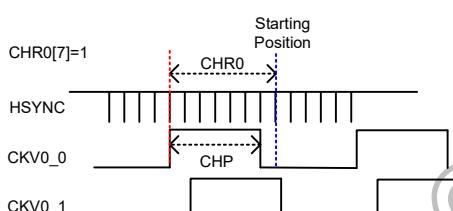

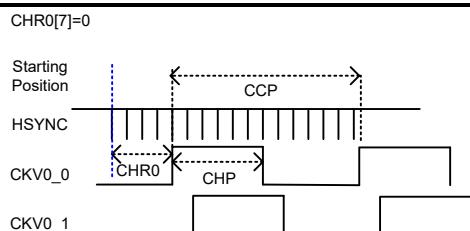

- **SHP[3:0]**: Specify the STV signal high pulse width.

<b>SHP[3:0] (Hex)</b>	<b>Width</b>
0	0 HSYNC
1	1 HSYNC
2	2 HSYNC
:	:
F	16 HSYNC

- **SCP[3:0]**: Specify the total number of STV signal.

<b>SCP[3:0] (Hex)</b>	<b>STV NO.</b>
0	1
1	2
2	3
:	:
F	16

#### Description

- **CHR[7:0]**: Specify the starting position of GIP CKV group 0 (CKV0\_0).
- **CHR2[7:0]**: Specify the starting position of GIP CKV group 1 (CKV1\_0).

CHR[7:0] CHR2[7:0] (Hex)	Starting Position
0	0 HSYNC
1	1 HSYNC
2	2 HSYNC
:	:
FF	255 HSYNC

## Description

- **CHP[3:0]**: Specify the CKV signal high pulse width.
- **CHP2[3:0]**: Specify the CKV1 signal high pulse width

CHP[3:0] CHP2[3:0] (Hex)	Width
0	1 HSYNC
1	2 HSYNC
2	3 HSYNC
:	:
F	16 HSYNC

- **CCP[3:0]**: Specify the total period cycle of CKV signal.
- **CCP2[3:0]**: Specify the total period cycle of CKV1 signal.

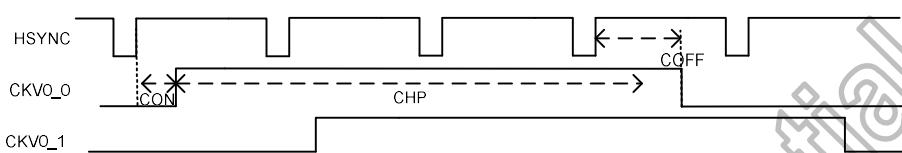

CCP[3:0] CCP2[3:0] (Hex)	CKV Period.
0	1 HSYNC
1	2 HSYNC
2	3 HSYNC
:	:
F	16 HSYNC

FORCELEAD

a-Si TFT LCD Single Chip Driver  
720RGB x 2047 dot with 16.7M color

- **CON[9:0]**: Specify the distance of CKV rising edge and HYSNC.
- **COFF[9:0]**: Specify the distance of CKV falling edge and HYSNC.
- **CON2[9:0]**: Specify the distance of CKV1 rising edge and HYSNC.
- **COFF2[9:0]**: Specify the distance of CKV1 falling edge and HYSNC.

CON[9:0] COFF[9:0] CON2[9:0] COFF2[9:0] (Hex)	Distance
0	0*(2/Fosc)
1	1*(2/Fosc)
2	2*(2/Fosc)
:	:
FF	255*(2/Fosc)

## Description

- **CGTS\_L[21:0]**: Select Left side GIP output pad signal.
  - 1: Output pad assign as STV.
  - 0: Output pad assign as CKV.
- **CGTS\_R[21:0]**: Select Right side GIP output pad signal.
  - 1: Output pad assign as STV.
  - 0: Output pad assign as CKV.
- **CGTS\_INV\_L[21:0]**: Reverse the polarity of Left side GIP output pad signal.
  - 1: Reverse the polarity.
  - 0: Normal polarity.
- **CGTS\_INV\_R[21:0]**: Reverse the polarity of Right side GIP output pad signal.
  - 1: Reverse the polarity.
  - 0: Normal polarity.

- **USER\_GIP\_GATE[7:0]**: Specify the extra gate counter at blanking area.

USER_GIP_GATE[7:0] (Hex)	Gate number
0	0
1	1
2	2
:	:
FF	255

- **COSx\_L[3:0]**: Specify Left side GIP output pad signal.
- **COSx\_R[3:0]**: Specify Right side GIP output pad signal.  
(x=1~22)

COS (Hex)	GIP OUTPUT		
	CGTS="1"	CGTS="0"	
	CKS="0"	CKS="1"	
0	STV0_0	CKV0_0	CKV1_0
1	STV0_1	CKV0_1	CKV1_1
2	STV0_2	CKV0_2	CKV1_2
3	STV0_3	CKV0_3	CKV1_3
4	STV1_0	CKV0_4	CKV1_4
5	STV1_1	CKV0_5	CKV1_5
6	STV1_2	CKV0_6	CKV1_6
7	STV1_3	CKV0_7	CKV1_7
8	Always Low	Always Low	
9	STV2_0	CKV All On	
A	STV2_1	YS1_Signal	
B	STV2_2	YS2_Signal	
C	STV2_3	CKV All On_2	
D	SMD_RST	YS1_Signal_2	
E	Display Area Line Ext	YS2_Signal_2	
F	Always High	Always High	

- **GIP\_OPT[22:0]**: Specify GIP optional setting for GIP signal.

This command is to set backward GIP timing.

- **YS1\_SEL[1:0]:** Specify YS1 Signal Mode.
- **YS2\_SEL[1:0]:** Specify YS2 Signal Mode.

YS1[1:0] YS2[1:0] (Hex)	YS1/YS2 Signal Mode
0	INYS1/INYS2
1	INYS1 or INVS2
2	INYS1 and INYS2

- **YS\_FLAG\_EN:** Enable YS signal function.
- **YS1\_XOR:** Reverse YS1 signal.
- **YS2\_XOR:** Reverse YS2 signal.
- **ALL\_ON\_EN:** Enable ALL ON function.
- **CK\_ALL\_ON\_EN:** Enable CKV ALL ON function.
- **STV\_ALL\_ON\_EN:** Enable STV ALL ON function.
- **USER\_GIP\_GATE[7:0]:** Specify the distance of GIP ALL On rising edge and DE.
- **CK\_ALL\_ON\_WIDTH1[5:0] / CK\_ALL\_ON\_WIDTH2[5:0] / CK\_ALL\_ON\_WIDTH3[5:0]:** Specify the timing of YS1 and YS2 signal.

FORCELEAD

a-Si TFT LCD Single Chip Driver  
720RGB x 2047 dot with 16.7M color

FL7707N

- **EQOPT[1:0]:** Specify GIP output EQ signal.

EQOTP (Hex)	P_EQ	N_EQ
0	Yes	Yes
1	No	Yes
2	Yes	No
3	No	No

- **EQ\_SEL[1:0]:** Specify GIP output EQ signal level.

EQ_SEL (Hex)	P_EQ	N_EQ
0	-	-
1	VSP	VSP
2	VSP	VSP
3	VSP	VSP

- **EQ\_DELAY[7:0]:** Specify the distance of EQ rising edge and HYSNC @ EQ\_SEL=0.

EQ_DEALY (Hex)	Distance
0	0*(2/Fosc)
1	1*(2/Fosc)
2	2*(2/Fosc)
:	:
FF	255*(2/Fosc)

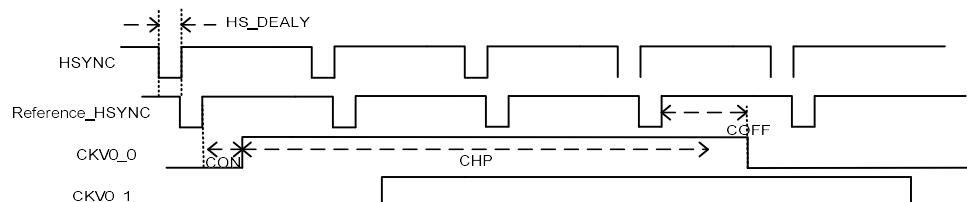

#### Description

- **EQ\_DELAY\_HSYNC[3:0]:** Specify the distance of EQ rising edge and HYSNC.

EQ_DEALY_HS (Hex)	Distance
0	0 Hsync
1	1 Hsync
2	2 Hsync
:	:
16	16 Hsync

- **HSYNC\_TO\_CL1\_CNT10[9:0]:** Specify the GIP reference HSYNC between external HSYNC

Hsync_to_Cl1_Cnt10[9:0] (Hex)	Distance
0	0/Fosc
1	1/Fosc
2	2/Fosc
:	:
1FF	511/Fosc

### 6.2.79 SETCOLOR (EBh)

Description	This command is used to record the Panel Optical Performance.									

## 7. Electrical Characteristics

### 7.1 Absolute maximum ratings

Item	Symbol	Unit	Spec.		
			Min.	Typ.	Max.
Power Supply Voltage 1	IOVCC~VSSD	V	-0.3	-	+5.5
Power Supply Voltage 2	VCI ~ VSSA	V	-0.3	-	+6.6
Power Supply Voltage 3	VSP ~ VSSA	V	-0.3	-	+6.6
Power Supply Voltage 4	VSSA ~ VSN	V	-0.3	-	+6.6
Power Supply Voltage 5	VGH ~ VGL	V	-0.3	-	+35
Logic Input Voltage	V <sub>IN</sub>	V	-0.3	-	IOVCC+0.3
Logic Output Voltage	V <sub>O</sub>	V	-0.3	-	IOVCC+0.3
Differential Input Voltage	DSI_CP/DSI_CN DSI_D0P/DSI_D0P, DSI_D1P/DSI_D1N	V	-0.3	-	2.0
Operating Temperature	T <sub>opr</sub>	°C	-40	-	+85
Storage Temperature	T <sub>stg</sub>	°C	-55	-	+110

Table 7-1: Absolute Maximum Ratings

## 7.2 DC characteristics

### 7.2.1 Basic Characteristics

#### External Power IC and PFM:

Parameter	Symbol	Conditions	Spec.			Unit
			Min.	Typ.	Max.	
<b>Power &amp; Operating Voltages</b>						
Logic Operating voltage	IOVCC	I/O supply voltage	1.65	1.8	3.3	V
Analog Operating voltage	VCI	Operation voltage	2.5	2.8	3.3	
<b>Input / Output</b>						
Logic High level input voltage	VIH	-	0.7IOVCC	-	IOVCC	V
Logic Low level input voltage	VIL	-	VSSD	-	0.3IOVCC	
Logic High level output voltage	VOH	IOH = -1.0mA	0.8IOVCC	-	IOVCC	
Logic Low level output voltage	VOL	IOL = +1.0mA	VSSD	-	0.2IOVCC	
Input leakage current	IIL	-	-1	-	1	µA
<b>DC/DC Converter Operation</b>						
VSP booster voltage	VSP	IVSP=1mA	4.5		6.2	V
VSN booster voltage	VSN	IVSN=-1mA	-6.2		-4.5	
VGH booster voltage	VGH	Ivgh=1mA	10		20	
VGL booster voltage	VGL	Ivgl=-1mA	-15		-7.5	
VGH and VGL difference	VGH-VGL	-	-	-	32	
Oscillator tolerance	OSC	25°C	-3		3	%
<b>Source Driver</b>						
Gamma reference voltage	VSPR	-	3.3		5.6	V
	VSNR	-	-5.6		-3.3	
Output voltage deviation	DVOS	VSSD+1.0 ~ VSPROUT-1.0	-	-	+/- 20	mV
		VSSD+0.1V ~ VSSD+1.0 VSPR-1.0 ~ VSPR-0.1V	-	-	+/- 50	mV
Output offset voltage	Voff	-		-	+/-50	mV
<b>Standby Mode Current Consumption</b>						
Sleep In Mode	VCI	Ta=25°C VCI=2.8V IOVCC=1.8V	-	150	-	µA
	IOVCC		-	50	-	

**3 Power Mode:**

Parameter	Symbol	Conditions	Spec.			Unit
			Min.	Typ.	Max.	
<b>Power &amp; Operating Voltages</b>						
Logic Operating voltage	IOVCC	I/O supply voltage	1.65	1.8	3.3	V
Analog Operating voltage	VCI	Operation voltage	4.5		6.2	
Analog Operating voltage	VSP	Operation voltage	4.5		6.2	
Analog Operating voltage	VSN	Operation voltage	-6.2		-4.5	
<b>Input / Output</b>

		VSSD+0.1V ~ VSSD+1.0 VSPR-1.0 ~ VSPR-0.1V	-	-	+/- 50	mV
Output offset voltage	Voff	-		-	+/-50	mV
<b>Standby Mode Current Consumption</b>						
Sleep In Mode	VSP	Ta=25°C VSP=5.4V VSN=-5.4V IOVCC=1.8V	-	150	-	μA
	VSN		-	50	-	
	IOVCC		-	35	-	

### 7.2.2 DSI DC Characteristics

LP Mode

Parameter	Symbol	Conditions	Spec.			Unit
			Min.	Typ.	Max.	
Logic high level input voltage	$V_{IHLPCD}$	LP-CD	450	-	1350	mV
Logic low level input voltage	$V_{ILLPCD}$	LP-CD	0	-	200	mV
Logic high level input voltage	$V_{IHLPRX}$	LP-RX(CLK, D0)	880	-	1350	mV
Logic low level input voltage	$V_{ILLPRX}$	LP-RX(CLK, D0)	0	-	550	mV
Logic low level input voltage	$V_{ILLPRXULP}$	LP-RX(CLK ULP mode)	0	-	300	mV
Logic high level output voltage	$V_{OHLPTX}$	LP-TX(D0)	1.1	-	1.3	V
Logic low level output voltage	$V_{OLLPTX}$	LP-TX(D0)	-50	-	50	mV
Logic high level input current	$I_{IH}$	LP-CD, LP-RX	-	-	10	uA
Logic low level input current	$I_{IL}$	LP-CD, LP-RX	-10	-	-	uA
Input pulse rejection	SGD	DSI-CLK+/-, DSI-D0+/1	-	-	300	Vps

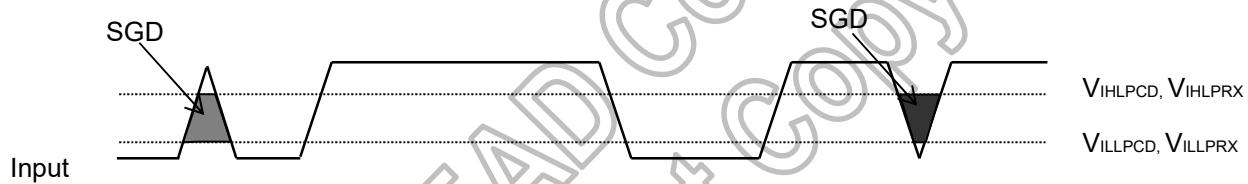

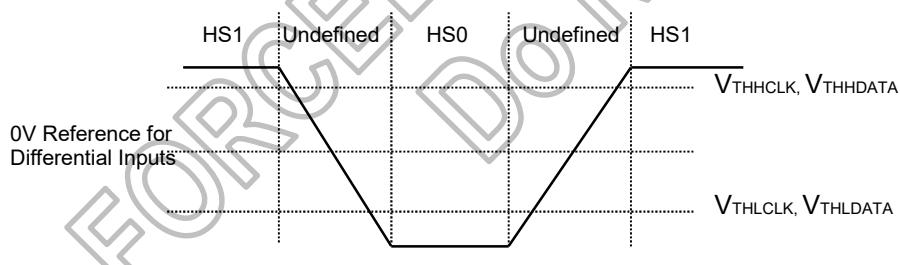

Figure 7-1: Input glitch rejections of low-power receivers

## High Speed Mode

Parameter	Symbol	Conditions	Spec.			Unit
			Min.	Typ.	Max.	
Input common mode	$V_{CMCLK}$ $V_{CMDATA}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	70	-	330	mV
Input common mode variation <450 MHZ	$V_{CMRCLKL}$ $V_{CMRDATAM}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-50	-	50	mV
Input common mode variation >450 MHZ	$V_{CMRCLKM}$ $V_{CMRDATAM}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	100	mV
Low-level differential Input threshold	$V_{THLCLK}$ $V_{THLDATA}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-70	-	-	mV
High-level differential Input threshold	$V_{THHCLK}$ $V_{THHDATA}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	70	mV
Single ended input low voltage	$V_{ILHS}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-40	-	-	mV
Single ended input high voltage	$V_{IHHS}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	460	mV
Differential input termination resistor	$R_{TERM}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	80	100	125	$\Omega$
Single-ended threshold voltage for termination enable	$V_{TERMEN}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	450	mV
Termination capacitor	$C_{TERM}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	-	pF

**Figure 7-2: Differential voltage range and Command mode voltage**

## 7.3 AC characteristics

### 7.3.1 Serial Interface Characteristics

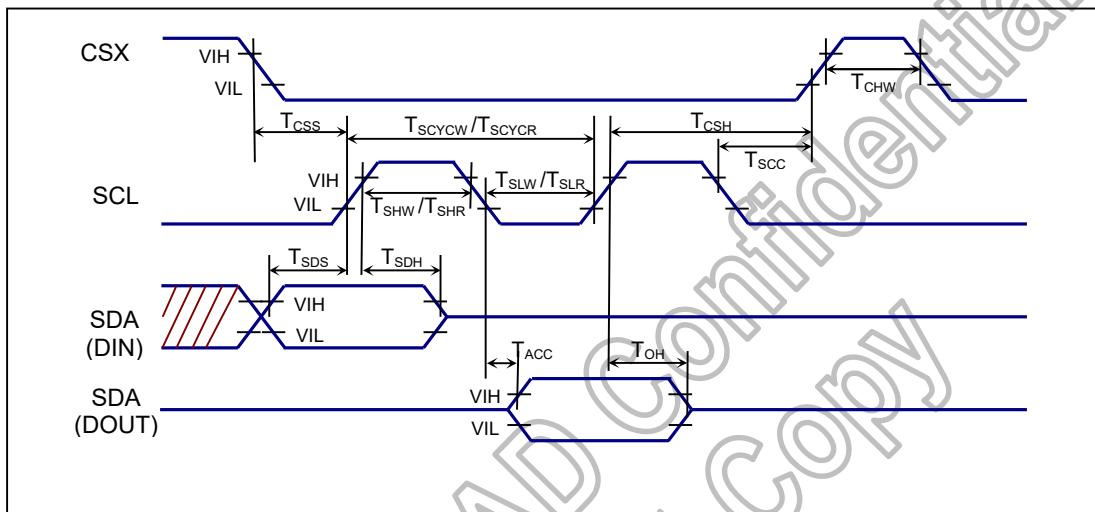

Figure 7-3: Serial Interface Characteristics

(VSSA=0V, IOVCC=1.8V, VCI=2.8V, TA = 25°C)

Signal	Symbol	Parameter	Min.	Max.	Unit	Description
CSX	t <sub>css</sub>	Chip select setup time (Write)	15	-	ns	-
	t <sub>css</sub>	Chip select setup time (Read)	60	-		
	t <sub>csd</sub>	Chip select hold time (Write)	15	-		
	t <sub>csd</sub>	Chip select hold time (Read)	65	-		
DCX	t <sub>ast</sub>	Address setup time	0	-	ns	-
	t <sub>aht</sub>	Address hold time (Write/Read)	10	-		
SCL (Write)	t <sub>wc</sub>	Write cycle	66	-	ns	-
	t <sub>wrh</sub>	Control pulse "H" duration	15	-		
	t <sub>wrl</sub>	Control pulse "L" duration	15	-		
SCL (Read)	t <sub>rc</sub>	Read cycle	150	-	ns	-
	t <sub>rhd</sub>	Control pulse "H" duration	60	-		
	t <sub>rld</sub>	Control pulse "L" duration	60	-		
SDA (Input)	t <sub>ds</sub>	Data setup time	10	-	ns	For maximum C <sub>L</sub> =30pF
	t <sub>dh</sub>	Data hold time	10	-		
SDA (Output)	t <sub>acc</sub>	Read access time	-	100	ns	For minimum C <sub>L</sub> =8pF
	t <sub>oh</sub>	Output disable time	10	-	ns	

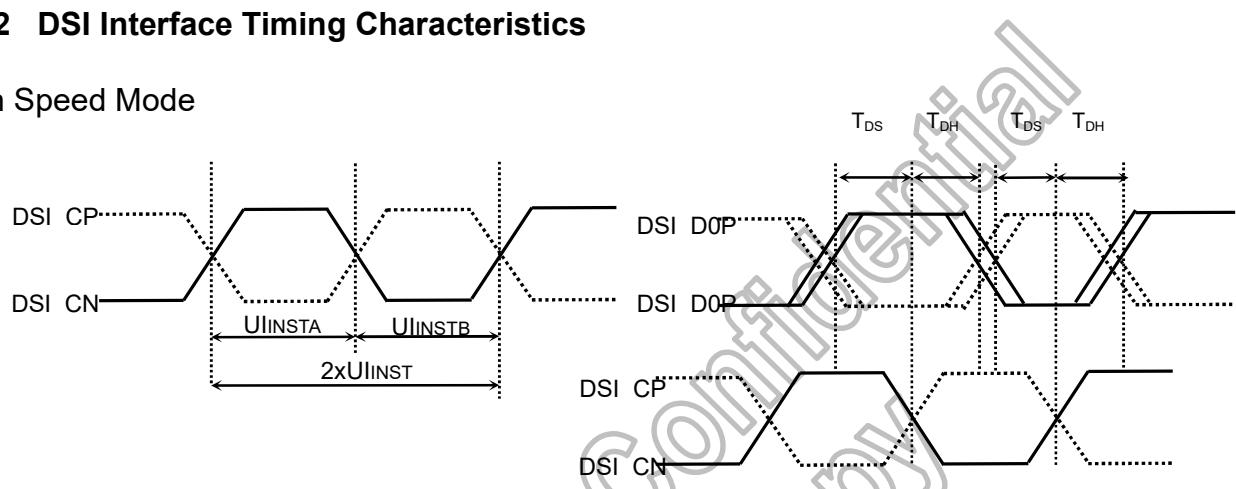

Note: The input signal rise time and fall time (tr, tf) is specified at 15 ns or less.

Logic high and low levels are specified as 30% and 70% of IOVCC for Input signals.

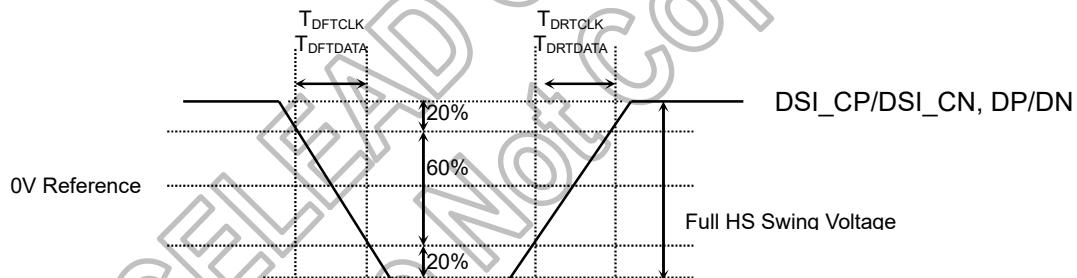

Table 7-2: Serial Interface Characteristics

### 7.3.2 DSI Interface Timing Characteristics

High Speed Mode

**Figure 7-4: DSI clock timing Characteristics**

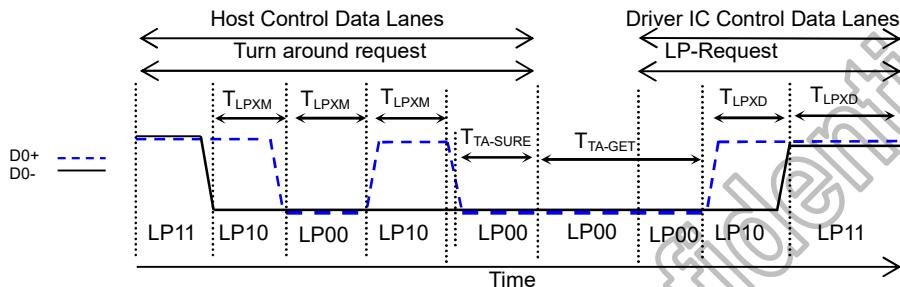

**Figure 7-5: Rising and falling time on clock and data channel**

(VSSA=0V, IOVCC=1.65V to 3.3V, VCI=2.5V to 3.3V, TA = -40 to 85°C)

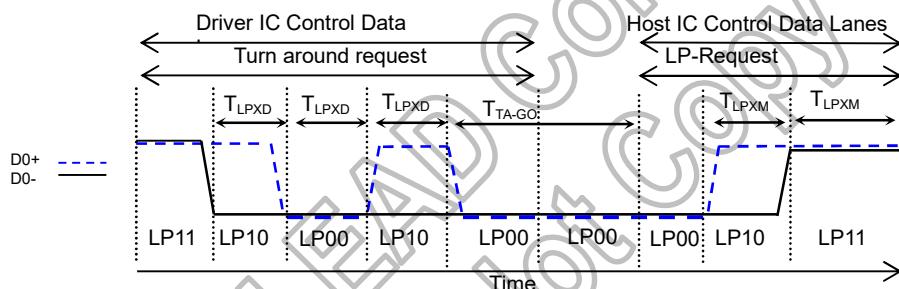

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_CP/ DSI_CN	Double UI instantaneous	2xUIINST	4LANE: 3.30 3LANE: 2.85 @ VDDD=1.8V	-	25	ns
	UI instantaneous	UIINSTA UIINSTB	4LANE: 1.67 3LANE: 1.43 @ VDDD=1.8V	-	12.5	ns
DP/DN	Data to clock setup time	T <sub>DS</sub>	0.15xUI	-	-	ps
DP/DN	Data to clock hold time	T <sub>DH</sub>	0.15xUI	-	-	ps
DSI_CP/ DSI_CN	Differential rise time for clock	T <sub>DRTCLK</sub>	150	-	0.3UI	ps
DSI_CP/ DSI_CN	Differential fall time for clock	T <sub>DFTCLK</sub>	150	-	0.3UI	ps
DP/DN	Differential rise time for data	T <sub>DRTDATA</sub>	150	-	0.3UI	ps
DP/DN	Differential fall time for data	T <sub>DFTDATA</sub>	150	-	0.3UI	ps

**Table 7-3: DSI High Speed Mode Characteristics**

### Low Power Mode

**Figure 7-6: BTA from HOST to Display Module Timing**

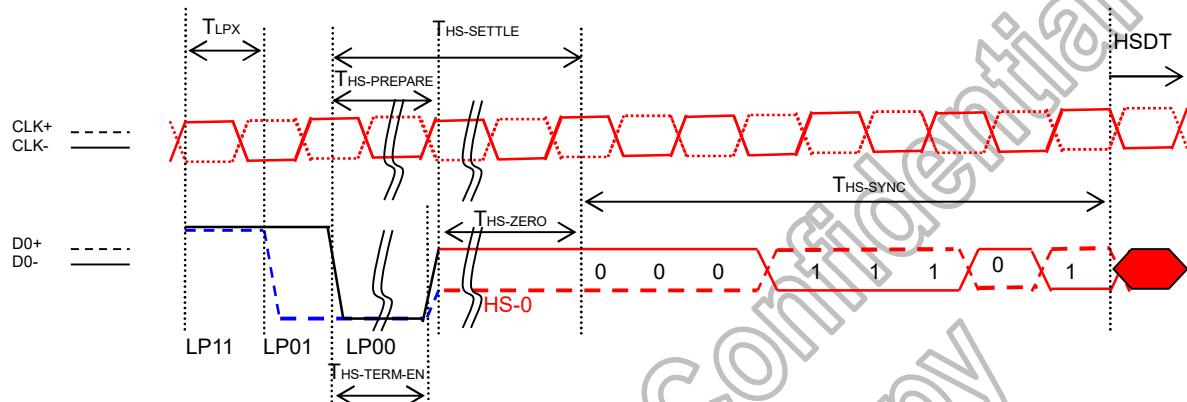

**Figure 7-7: BTA from Display Module Timing to HOST**

(VSSA=0V, IOVCC=1.65V to 3.3V, VCI=2.3V to 3.3V, TA = -40 to 85°C)

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_D0P/ DSI_D0P	Length of LP-00/LP01/LP10/LP11 Host → Display module	T <sub>LPXM</sub>	50	-	-	ns
	Length of LP-00/LP01/LP10/LP11 Display module → Host	T <sub>LPXD</sub>	50	-	-	ns
	Time-out before the MPU start driver	T <sub>TA-SURE</sub>	T <sub>LPXD</sub>	-	2xT <sub>LPXD</sub>	ns
	Time to drive LP-00 by display module	T <sub>TA-GET</sub>	5xT <sub>LPXD</sub>	-	-	ns
	Time to drive LP-00 after turnaround request Host	T <sub>TA-GO</sub>	4xT <sub>LPXD</sub>	-	-	ns

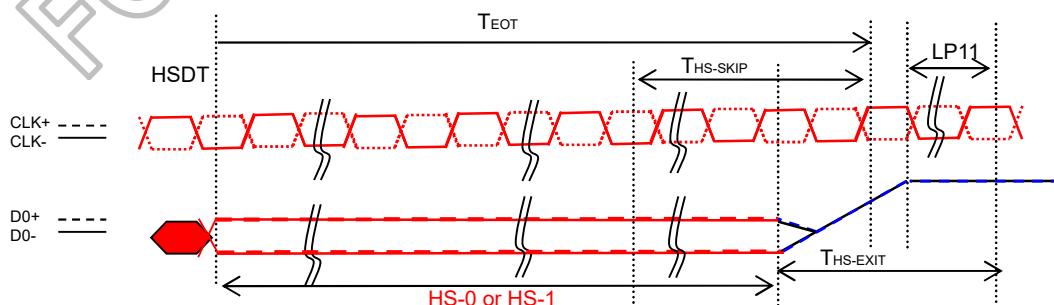

**Table 7-4: DSI Low Power Mode Characteristics**

## DSI BURSTS

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_D0P/ DSI_D0P	Length of LP-00/LP01/LP10/LP11	T <sub>LPX</sub>	50	-	-	ns
	Time to Driver LP-00 to prepare for HS transmission	T <sub>HS-PREPARE</sub>	40+4UI	-	85+6UI	ns
	Time to enable data receiver line termination	T <sub>HS-TERM-EN</sub>	-	-	35+4xUI	ns
	Time to drive LP-00 by display module	T <sub>TA-GET</sub>	5xT <sub>LPXD</sub>	-	-	ns
	Time to drive LP-00 after turnaround request Host	T <sub>TAGO</sub>	4xT <sub>LPXD</sub>	-	-	ns

Table 7-5: DSI Low Power Mode to High Speed Mode Timing

## NOTE:

If the last bit is HS-0, the transmitter changes from HS-0 to HS-1  
If the last bit is HS-0, the transmitter changes from HS-1 to HS-0

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_D0P/ DSI_D0P	Time-Out at Display Module to Ignore Transition Period of EoT	T <sub>HS-SKIP</sub>	40	-	55+4xUI	ns
	Time to Driver LP-11 after HS Burst	T <sub>HS-EXIT</sub>	100	-	-	ns

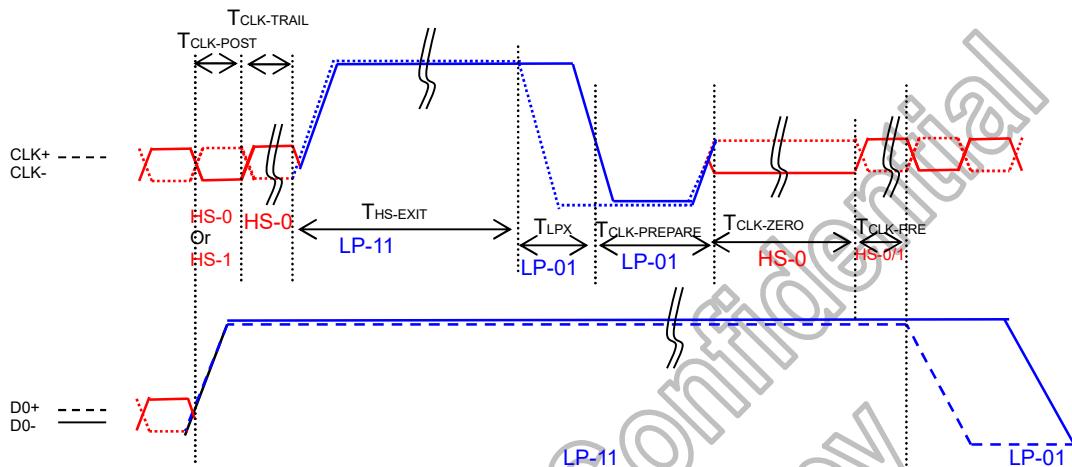

Table 7-6: DSI Low Power Mode to High Speed Mode Timing

FORCELEAD

a-Si TFT LCD Single Chip Driver  
720RGB x 2047 dot with 16.7M color

FL7707N

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_CP/ DSI_CN	Time that the MCU shall continue sending HS clock after the last associated Data Lane has transitioned to LP mode	TCLK-POST	60+52xUI	-	-	ns
	Time to drive HS differential state after last payload clock bit of a HS transmission burst	TCLK-TRAIL	60	-	-	ns
	Time to drive LP-11 after HS burst	THS-EXIT	100	-	-	ns
	Time to drive LP-00 to prepare for HS transmission	TCLK-PREPARE	38	-	95	ns
	Time-out at Clock Lane Display Module to enable HS Termination	TCLK-TERM-EN	-	-	38	ns
	Minimum lead HS-0 drive period before starting Clock	TCLK-PREPARE + TCLK-ZERO	300	-	-	ns
	Time that the HS clock shall be driven prior to any associated data Lane beginning the transition from LP to HS mode	TCLK-PRE	8xUI

### 7.3.3 Reset input timing

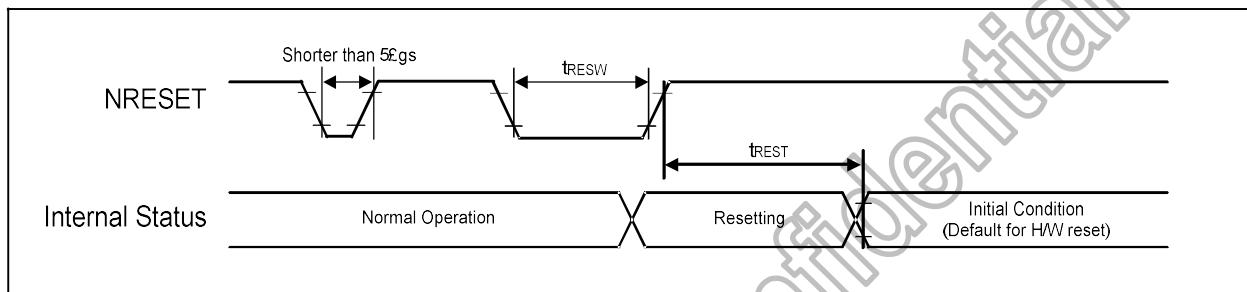

Figure 7-8: Reset input timing

Symbol	Parameter	Related Pins	Spec.			Note	Unit
			Min.	Typ.	Max.		
tRESW	Reset low pulse width <sup>(1)</sup>	NRESET	10	-	-	-	μs
tREST	Reset complete time <sup>(2)</sup>	15	-	-	When reset applied during SLPIN mode	ms	
		120	-	-	When reset applied during SLOUT mode	ms	

Table 7-8: Reset Input Timing

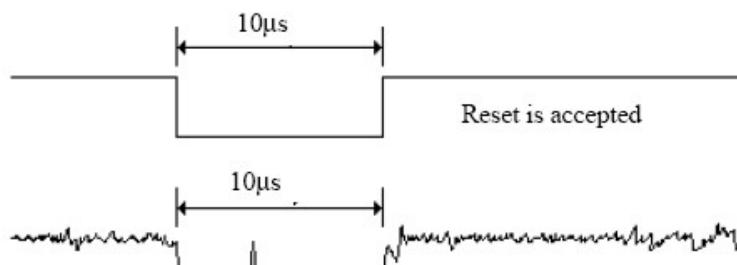

Note: (1) Spike due to an electrostatic discharge on NRESET line does not cause irregular system reset according to the following table.

NRESET Pulse	Action
Shorter than 5 μs	Reset Rejected
Longer than 10 μs	Reset
Between 5 μs and 10 μs	Reset Start

(2) During the resetting period, the display will be blanked (The display is entering blanking sequence, which Maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In –mode) and then return to Default condition for H/W reset.

(3) During Reset Complete Time, ID and VCOM value in OTP will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (tREST) within 15ms after a rising edge of NRESET.

(4) Spike Rejection also applies during a valid reset pulse as shown as below:

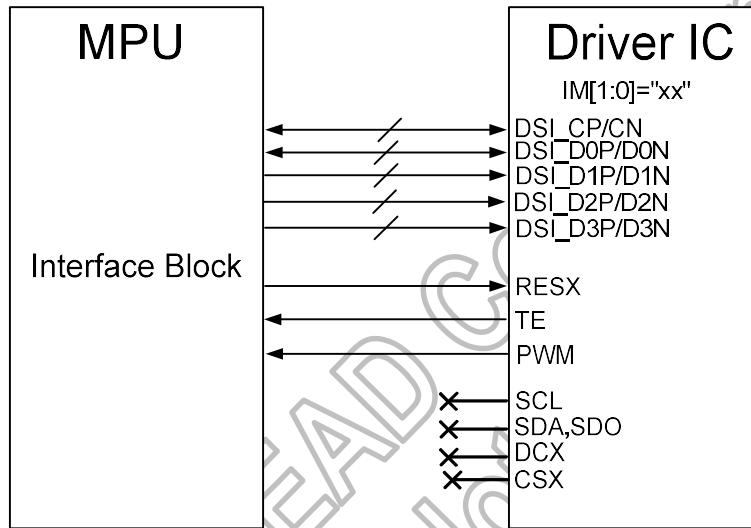

(5) It is necessary to wait 15msec after releasing NRESET before sending commands. Also Sleep Out command cannot be sent for 120msec.

## 8. Reference Application

### 8.1 Interface

The display, which is using DSI interface, is connected to the MPU as it is illustrated below.

**Figure 8-1: Interfacing for MIPI by Setting Lane [1:0] = "11"**

**Notes:**

1. When *TE* is not in use, please let it open.
2. When *PWM* is not in use, please let it open.
3. Connect *DSI\_D3\_P/N* to *DSI\_VSS* in 3 data lanes application (*LANE[1:0]* = "10").
4. Connect *DSI\_D3P/N* and *DSI\_D2P/N* to *DSI\_VSS* in 2 data lanes application (*LANE[1:0]* = "01").

## 8.2 Connections with Panel

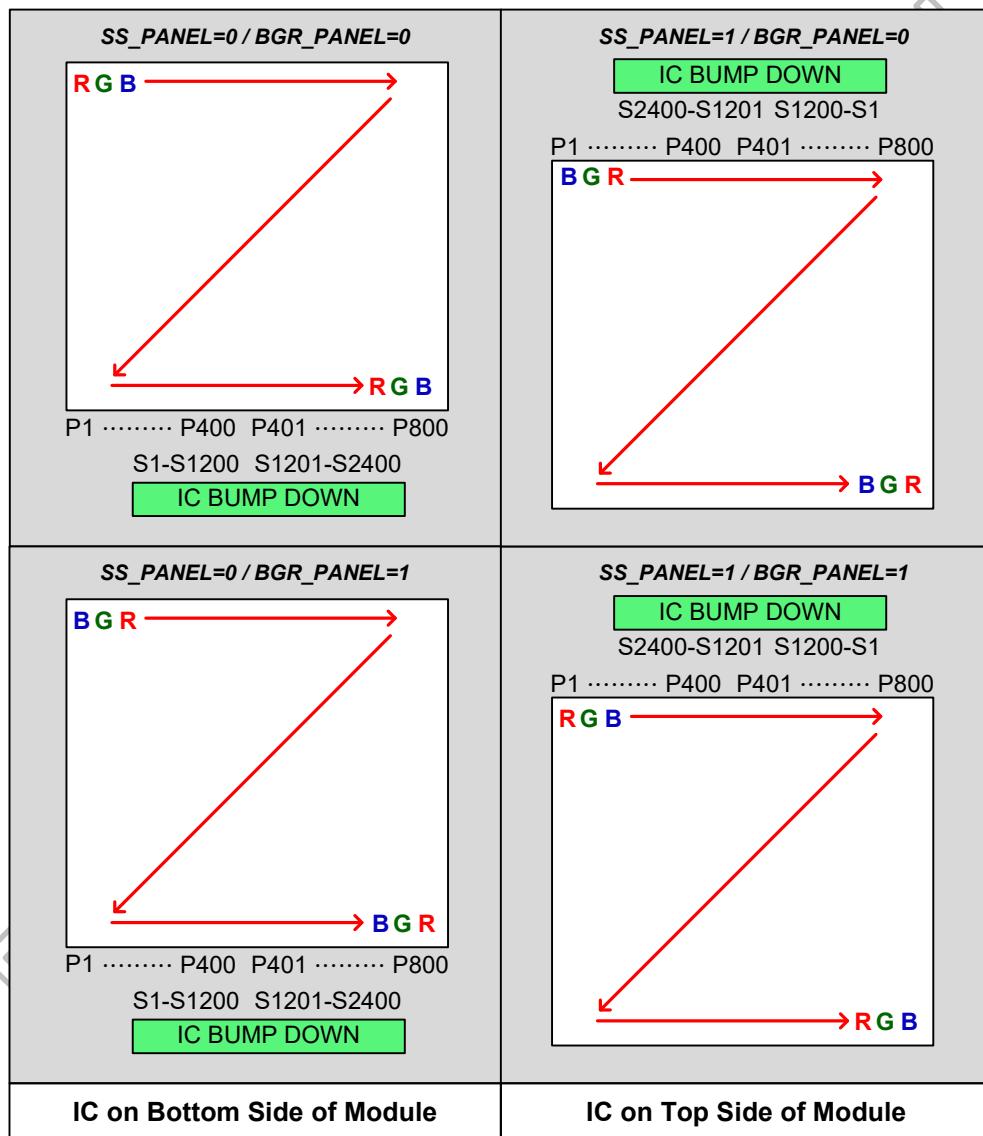

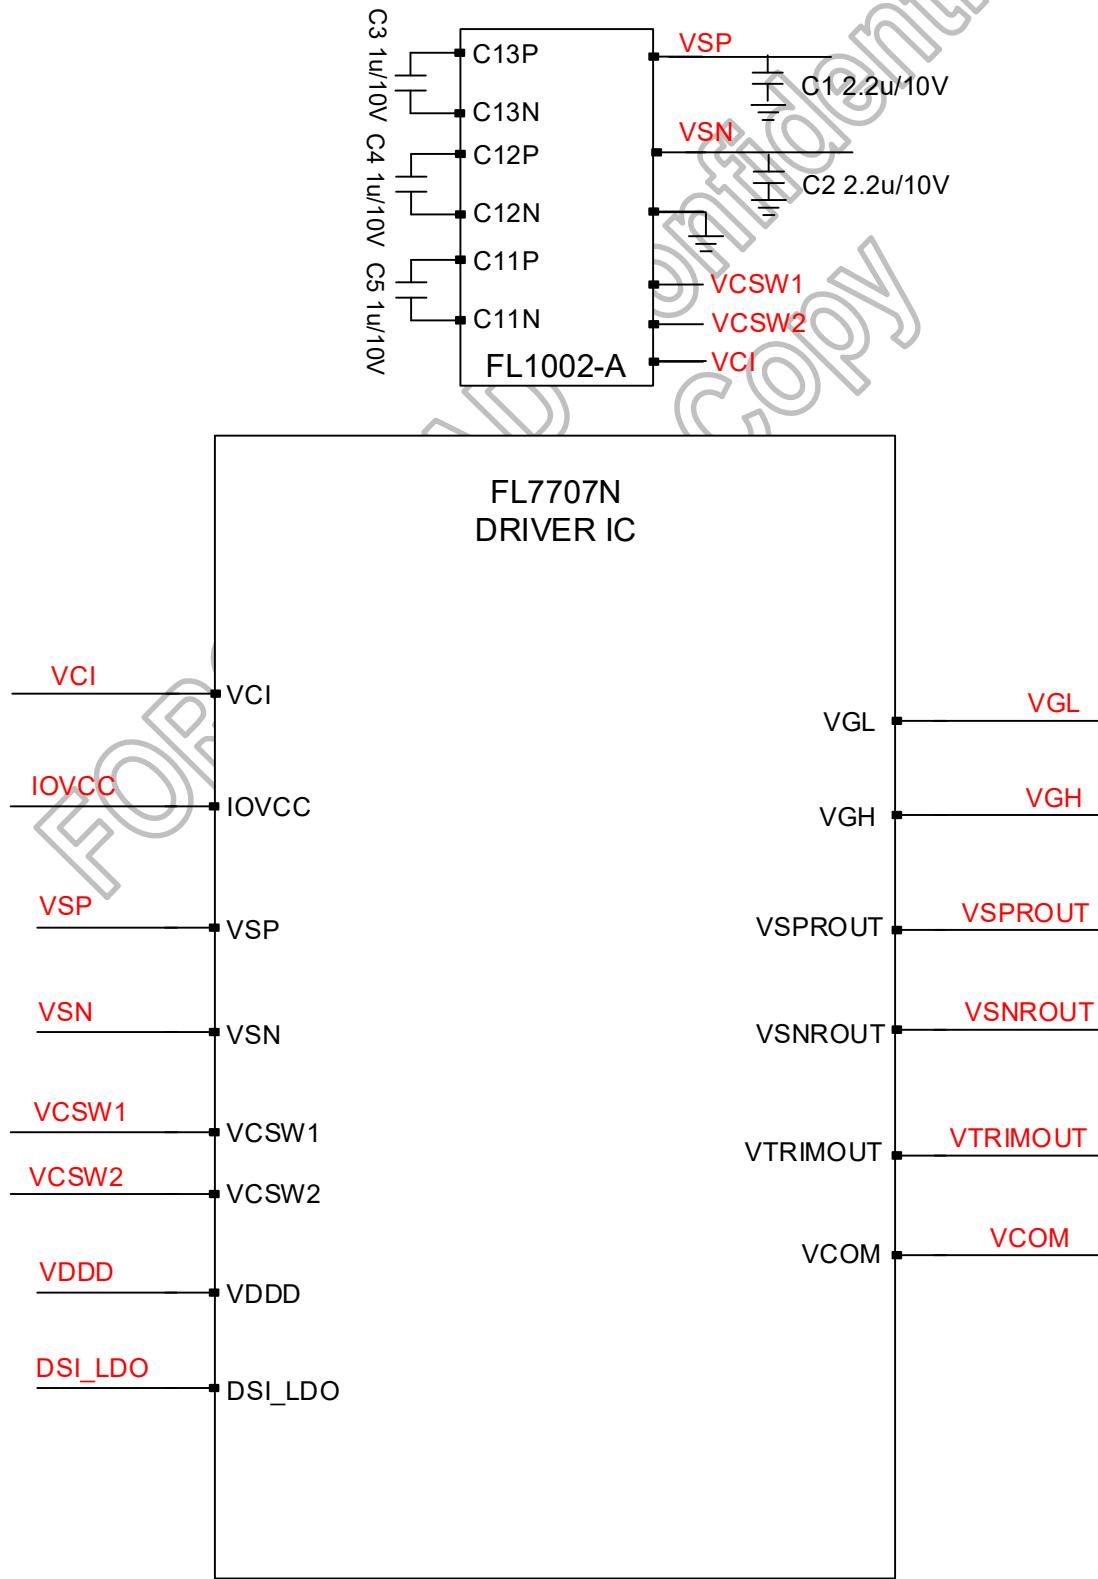

Figure 8-2: Source Pin Connection for Panel
